FOREWORD

Thank you for your purchase of the CASIO fx-8500G.

This unit is a totally new type of advanced programmable computer. Besides various scientific functions, graph functions also make it possible to produced a wide variety of useful graphs.

Manual computations can be easily performed following written formulas (true algebraic logic). A replay function is provided that allows confirmation or correction when key operation errors occur. Programs can also be input by following true algebraic logic, so repeat and/or complex computations are simplified.

This manual is composed of six sections:

- 1. Configuration and Operation
- 2. Manual Computations
- 3. Graphs
- 4. Program Computations
- 5. File Editor Function
- 6. Convenient Option

Section 1 should be read first to become familiar with the nomenclature, handling and cautions concerning this unit. Sections 2, 3, 4, 5 and 6 can then be read in order to master each type of functions through samples and explanations.

- The information contained herein is subject to change without notice.
- Reproduction of this manual either in part or its entirety is forbidden.
- Note that the manufacturer assumes no responsibility for any injury or loss incurred while using this manual.
- The manufacturer assumes no responsibility for direct losses or losses suffered by third parties due to alterations or deletion of programs or data caused by malfunction of the unit, maintenance or repairs, battery replacement, etc. Physical records of important data or programs should be recorded on cassette tape using a recorder connected via the optional FA-80 interface unit.
- Due to limitations imposed by printing processes, the displays shown in this manual are only approximations and may differ somewhat from actual displays.

HANDLING PRECAUTIONS

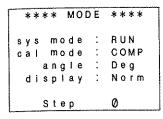

- ◆ This unit is composed of precision electronic components and should never be disassembled. Do not drop it or otherwise subject it to sudden impacts or sudden temperature changes. Be especially careful to avoid storing the unit or leaving it in areas exposed to high temperature, humidity or large amounts of dust. When exposed to low temperatures, the unit will require more time to display answers and may even fail to operate. The display will return to normal once normal temperature is attained.
- Batteries should be replaced every 2 years even if the unit is not used for extended periods. Never leave dead batteries in the battery compartment. They can leak and cause damage to the unit.
- Avoid using volatile liquids such as thinner or benzine to clean the unit. Wipe the unit with a soft, dry cloth or a cloth that has been dipped in a neutral detergent solution and wrung out.
- If malfunction of the unit should occur, either bring or send the unit to your retailer or the nearest CASIO dealer.
 Be sure to clearly explain the problem in detail.
- Before assuming malfunction of the unit, be sure to carefully reread this manual and ensure that the problem is not due to insufficient battery power, programming or operational errors.

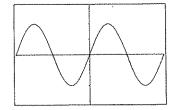

1-1 NOMENCLATURE AND FUNCTIONS

Display window

The display window is capable of displaying 16-character by 8-line text and symbols. Graphs are produced on a 95 by 63-dot matrix. A system display as shown on the left indicates the following: the system mode (sys mode), calculation mode (cal mode), angle unit (angle), number of decimal places or number of significant digits (display), and key input buffer status (Step).

The display on the right shows a sine graph as a representative example of the graphs.

The letter "O" is distinguished from zero by adding a slash for the zero (0).

Power switch

Power is turned ON by sliding the power switch to the left. Sliding the power switch to the right turns power OFF.

■ Graphic print switch

Used to specify the density of graph printout (see page 179). Keep set to N during normal computations.

Special operation keys

SHIFT Shift key

Press when using the function commands and functions marked in brown on the key panel. An S will blink on the display to indicate that the state of the state of

* The function of input keys is different in the file editor mode (see page 162).

MODE Mode Key

Press when setting the status of the unit or the unit of angular measurement.

- MODE ① ... Specifies file editor mode.
- MODE ... For manual computations and program execution.
- MODE 2 ... For writing or checking programs.
- MODE 3 ... For clearing programs.
- MODE 4 ... Deg displayed. If EXE is pressed, unit of angular measurement is specified as degress.
- MODE 5 ... Rad displayed. If EXE is pressed, unit of angular measurement is specified as radians.
- MODE 6 ... Gra displayed. If EXE is pressed, unit of angular measurement is specified as grads.
- will specify the number of decimal places according to the value entered.

Ex. MODE 7 3 EXE → Three decimal places

- MODE ③ ... Sci displayed. Entering a value from 0 to 9 followed by EXE will specify the number of significant digits from 1 to 10.

 Ex. MODE ⑤ □ EXE → 5 significant digits
- MODE 9 ... Norm displayed. Pressing EXE will cancel the specified number of decimal places or the specified number of significant digits.
- MODE ... Defm displayed. Entering a value followed by EXE will specify the number of memories available.

Ex. $\underline{\text{MODE}}$ \boxdot 11 \bigcirc $\underline{\text{EXE}}$ \rightarrow Number of memories available increased by 10.

If EXE is pressed without entering a value, the current number of memories available and remaining steps will be displayed. (See page 24.)

Ex. MODE TEXE

Defm

Program : 56

Memory : 36

6430 Bytes Free

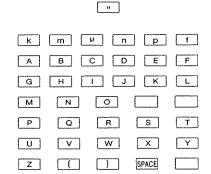

- MODE : ... Specifies COMP mode for arithmetic computation or function computation (program execution possible).
- MODE : ... For binary, octal or hexadecimal computations/conversions.

- WODE EXP ... Switches print mode ON and OFF. In the file editor mode, switches between password and non-password status.
- MODE Ans ... Recalls the key input buffer. The last formula can be recalled ed even if the AC key has been pressed.
- WODE ⊠ ... For standard deviation computations (SD1 mode).
- MODE : ... For regression computations (LR1 mode).
- SHIFT MODE

 ... For production of a bar graph, line graph or normal distribution curve according to single variable statistical data (SD2 mode).
- SHIFT MODE : ... For production of a regression line according to paired variable statistical data (LR2 mode).
- MODE 4... Pressed after a numeric value representing degrees is input.
- MODE 5 ... Pressed after a numeric value representing radians is input.
- SHET MODE 6 ... Pressed after a numeric value representing grads is input.

Alphabet key

Press to input alphabetic characters or special characters. Pressing ALPHA displays and allows the input of only one character. After that, the unit returns to the status it was in before the ALPHA key was originally pressed. Pressing ALPHA will lock the unit in this mode and allow consecutive input of alphabetic characters until ALPHA is pressed again.

^{*} The function of input keys is different in the file editor mode (see page 162).

Prog Program/Goto key

Press Prog, enter a value from 0 to 9 and then press EXE to execute a program.

Ex. Prog I EXE → Execution of Program 1 begins.

Pressing SHIFT followed by Goto (Prog key) will cause Goto to appear on the display. This is a jump command used in programs.

Cursor/Replay keys

Press to move the cursor (blinking "__") left, right, up, and down on the display. The \(\beta \) key moves the cursor to the left, \(\beta \) moves the cursor to the right, \(\beta \) moves the cursor up, and \(\beta \) moves the cursor down. Holding any of the keys down will cause the cursor to continuously move in the respective direction.

Once a formula or numeric value is input and EXE is pressed, the skey and skey become "replay" keys. In this case, pressing significantly displays the formula or numeric value from the beginning, while pressing significantly displays it from the end. This allows the formula to be executed again by changing the values.

Pressing the cursor key following shift changes their functions to those marked above the keys.

ഥ (호) is used to input labels within programs.

INS () inserts a space at the current position of the cursor. Line () makes it possible to produce line graphs or regression lines. The x-y () key makes it possible to switch the X and Y coordinate display during graph trace operations.

and following the work key are used for contrast adjustments. (See page 12.)

Delete key

Press to delete the character at the current position of the cursor. When the character is deleted, everything to the right of the cursor position will shift one space to the left.

Pressing SHFT DEL EXE will clear the memory contents.

AC All clear key

Press to completely clear the displayed formulas, numeric values or texts, and to clear all of the input buffer contents. Also used to release errors indicated by error message displays, and to restore power after reactivation of the auto power off function. (See page 27.)

Pressing AC during graph creation or program execution suspends the operation. A suspended operation can be resumed by pressing

EXE Execute key

Press to obtain the result of a computation or to draw a graph. Pressed after data input for a programmed computation or file data input, or to advance to the next execution after a computation result is obtained.

Answer key

Pressing Ans followed by EXE will recall the last computation result. It can be recalled by Ans EXE even after it has been cleared using the AC key or by switching the power of the unit OFF. When used during program execution, the last result computed is recalled.

Pressed after sher to enter the print command for computation results, program lists, or graphs.

 \blacksquare $\square \sim \boxdot$, \boxdot , \boxdot XP Numeric/Decimal point/Exponent input keys

When entering numeric values, enter the number in order. Press the \Box key to enter the decimal point in the desired position.

To input 1.23×10^{-6} , press $1 \odot 23$ EXP (-) 6.

SHIFT key combinations for the various modes are as follows:

COMP mode (MODE ⊞)	Base-n mode (MODE □)
+	•
isz a s	Isz ≥ ≤
Dsz > <	Dsz > <
Rnd Rans π	
	Pol(, Rec(, Rnd, Ran# and π cannot be used in this mode.

Standard deviation functions can be used.

Paired variable statistic functions can be used.

Computation keys

⊞ ⊠ ⊞ Arithmetic operation keys

For addition, subtraction, multiplication and division, enter the computation as it reads. SHIFT key combinations for the various modes are as follows:

COMP mode or SD mode

Pol(Rec() ($\stackrel{\text{Pol}(x,y)}{+}$ and $\stackrel{\text{Rec}(x,n)}{-}$ keys) ... Coordinate transformation

LR mode

Follows: Lestimated value computation of x and y

Graph keys

Used to produce a variety of graphs (see page 57 for details). These keys cannot be used in the Base-n mode.

Mode display/Plot key

- Used to confirm the status of the system mode, calculation mode, angle unit and rounding. Setting status is displayed only while this key is pressed.
- Pressed following shift to plot a point on the graph screen.

Graph Graph/Trace key

- Pressed before entering a formula to be used for a graph ("Graph Y=" appears on the display).
- Pressed following SHIFT to trace over an existing graph and display the *x* or *y* coordinate value.

Range | Range | Factor key

- Used to confirm or set the range and size of graphs.
- Pressed following shift to magnify or reduce the upper and lower ranges of graphs.

G-T Graph-text/Clear screen key

- Switches between the graph display and text display (see page 20).
- SHIFT CIS EXE clears the graph display. The text display cannot be cleared using this operation.

Function keys

Press for functional computation. Various uses are available in combination with the shift key, and/or depending on the mode being used.

Multistatement/Display key

- Press to separate formulas or commands in programmed computations or consecutive computations.
- The result of such combinations is known as a multistatement. (See page 38.)

When pressed following the SHET key, the results of each section of the programmed computations or consecutive computations are sequentially displayed with each press of EXE.

Engineering/Negation key

Press to convert a computation result to an exponential display whose exponent is a multiple of three.

$$(10^3 = \overset{\text{kilo}}{K}, 10^6 = \overset{\text{mega}}{M}, 10^9 = \overset{\text{gigs}}{G}, 10^{-3} = \overset{\text{milli}}{m}, 10^{-6} = \overset{\text{micro}}{\mu}, 10^{-9} = \overset{\text{nano}}{n}, 10^{-12} = \overset{\text{pico}}{p})$$

- When obtaining logical negation for a value in the Base-n mode, press prior to entering the value.
- Press following the SHIFT key in the Base-n mode to obtain the exclusive logical sum.

Root/Integer key

- Press prior to entering a numeric value to obtain the square root of that value.
- When pressed following the SHIFT key, the integer portion of a value can be obtained.
- Press followed by EXE in the Base-n mode to specify the decimal computation mode.
- When pressed following the subsequently entered value is specified as a decimal value.

x^{i} Square/Fraction key

- Press after a numeric value is entered to obtain the square of that value.
- When pressed following the SHIFT key, the decimal portion of a value can be obtained.
- Press followed by EXE in the Base-n mode to specify the hexadecimal computation mode.
- When pressed following the SHFT key in the Base-n mode, the subsequently entered value is specified as a hexadecimal value.

Common logarithm/Antilogarithm key

- Press prior to entering a value to obtain the common logarithm of that value.
- When pressed following the SHIFT key, the subsequently entered value becomes an exponent of 10.
- Press followed by EXE in the Base-n mode to specify the binary computation mode.
- When pressed following the SHIFT key in the Base-n mode, the subsequently entered value is specified as a binary value.

Natural logarithm/Anti-natural logarithm key

- Press prior to entering a value to obtain the natural logarithm of that value.
- ullet When pressed following the subsequently entered value becomes an exponent of e.
- Press followed by EXE in the Base-n mode to specify the octal computation mode.
- When pressed following the SHFT key in the Base-n mode, the subsequently entered value is specified as an octal value.

x^{-1} Reciprocal/Factorial key

- Press after entering a value to obtain the reciprocal of that value.
- When pressed following the SHIFT key, the factorial of a previously entered value can be obtained.
- ◆ Press in the Base-n mode to enter A (10₁0) of a hexadecimal value.

Degree/minute/second key (decimal → sexagesimal key)

- Press to enter sexagesimal value. (degree/minute/second or hour/minute/second).
 - Ex. 78°45'12"→78 ···· 45 ··· 12 ···
- When pressed following the shell key, a decimal based value can be displayed in degrees/minutes/seconds (hours/minutes/seconds).
- ◆Press in the Base-n mode to enter B (11₁₀) of a hexadecimal value.

hyp Hyperbolic key

- Pressing hyp, and then sin, cos, or tan prior to entering a value produces the respective hyperbolic function (sinh, cosh, tanh) for the value.
- Pressing SHFT, then hyp and then sin, cos, or tan prior to entering a value produces the respective inverse hyperbolic function (sinh-1, cosh-1, tanh-1) for the value.
- Press in the Base-n mode to enter C (12₁₀) of a hexadecimal value.

In cos trigonometric function/Inverse trigonometric function keys

- Press one of these keys prior to entering a value to obtain the respective trigonometric function for the value.
- Press salf and then one of these keys prior to entering a value to obtain the respective inverse trigonometric function for the value.
- Press in the Base-n mode to enter D, E, F (13₁₀, 14₁₀, 15₁₀) of a hexadecimal value.

🖲 Minus key

- Press prior to entering a numeric value to make that value negative.
 Ex. -123→ (-) [] [2] [3]
- When pressed following the same numeric value can be assigned to multiple memories.
- Ex. To assign the value 456 to memories A through F: 4 5 6 -
- Press in the Base-n mode prior to entering a value to obtain the negative of that value. The negative number is the two's complement of the value entered.

Assignment key

- Press prior to entering a memory to assign the result of a computation to that memory.
 - Ex. To assign the result of 12+45 to memory A: 11 2 + 4 5 ALPHA
- During execution of program computations or consecutive computations, press following the SHIFT key to enter a numeric value.

Parenthesis keys

- Press the open parenthesis key and the closed parenthesis key at the position required in a formula.
- When pressed following the SHIFT key, a comma or semicolon can be inserted to separate the arguments in coordinate transformation or consecutive computations.

Power/Absolute value key

- Enter x (any number), press this key and then enter y (any number) to compute x to the power of y.

 In the SD or LR mode, this function is only available after pressing the sum key.
- Press following the SHIFT key to obtain the absolute value of a subsequently entered numeric value.
- Press in the Base-n mode to obtain a logical product ("and").
- Press in the SD or LR mode to delete input data.

Root/Cube root key

- Enter x, press this key and then enter y to compute the xth root of y. In the SD or LR mode, this function is only available after pressing the shift key.
 - Press following the superior key to obtain the cube root of a subsequently entered numeric value.
 - Press in the Base-n mode to obtain a logical sum ("or").
 - Used as a data input key in the SD or LR mode.

Contrast adjustment

Pressing the or key following the ey adjusts the contrast of the display. Pressing makes the screen lighter, while makes it darker. Holding either key down will cause the display to successively become respectively lighter or darker.

Pressing any other key besides MODE, 🗢, or 🖘 (as well as 🐧, 🕔) cancels contrast adjustment.

- * Light display contrast even at the darkest setting indicates that battery power is too low. In this case, replace batteries as soon as possible.
- * Contrast adjustment is impossible during range display using the Range key. (See page 61.)

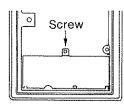

1-2 POWER AND BATTERY REPLACEMENT

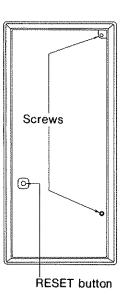

Power is supplied to this unit by three lithium batteries (CR2032C). If the power of the batteries should diminish, the display will weaken and become difficult to read. A weak display even after contrast adjustment (see page 12) may indicate power is too low, so the batteries should be replaced. When making replacements, be sure to replace all three batteries.

- * If batteries are used for longer than two years, there is the danger of leakage. Be sure to replace batteries at least once every two years even if the unit is not used during that period.
- * Stored programs or data are erased when batteries are replaced. Therefore, it is recommended that programs and data required for later use be recorded on a coding sheet or tape (using the optional interface unit) before replacing batteries.
- * Be sure to use batteries specified by Casio.

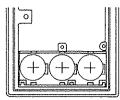

Procedure

- ① Slide the power switch to the OFF position, remove the two screws on the back of the unit with a screwdriver, and remove the back cover.
- ② Remove the screw holding the battery plate in place and remove the plate.
- 3 Remove the three old batteries from the unit.
- ④ Wipe the surfaces of three new batteries with a soft, dry cloth and load them into the unit ensuring that the positive ⊕ sides are facing upwards.

(5) Replace the battery plate, the battery plate screws, the back of the unit, and the back cover screws.

* IMPORTANT: Never dispose of old batteries in such a way that they will be incinerated. Batteries may explode if exposed to fire.

CAUTIONS:

- ① Replace the batteries as soon as possible when the display of the calculator becomes dim and difficult read.
- ② Be sure to turn power OFF before replacing batteries.
- 3 Always ensure that battery polarity is correct.
- 4 Note that the calculator will retain programs and memory contents only if you replace batteries within 10 minutes. If batteries are removed from the unit more than 10 minuts, programs and memory contents may be erased or altered.

In this case, the RESET button located on the back of the unit should be pressed using a pointed object with the power ON after batteries are replaced.

All memory contents and programs will be erased.

Keep batteries out of the reach of small children. If a battery should inadvertently be swallowed, contact a doctor immediately.

1-3 BEFORE BEGINNING COMPUTATIONS...

Computation priority sequence

This unit employs true algebraic logic to compute the parts of a formula in the following order:

- 1. Coordinate transformation Pol (x, y), Rec (r, θ)
- 2. Type A functions* x^2 , x^{-1} , x!, °, τ , g, °'''
- Power/root x^y, ^x√
- 4. Abbreviated multiplication format in front of π or memory 2π , 4R, etc.
- 5. Type B functions* $\sqrt{}$, $\sqrt[3]{}$, \log , 10^x , \ln , e^x , \sin , \cos , \tan , \sin , \cos , \tan , \sin , \sinh , \cosh , \tanh , \tanh , (-), Abs, \ln , Frac, h, d, b, o, Neg, Not
- 6. Abbreviated multiplication format in front of Type B functions or parenthesis 3sin5, $6\sqrt{7}$, 2sin30cos60, etc.
- 7 X ÷
- 8. +, -
- 9. and
- 10. or, xor
- 11. Relational operators $\langle , \rangle = , +, \leq , \geq$
- * Functions are divided into two types.

Type A functions are entered after the argument, while Type B functions are entered before the argument.

- * When functions with the same priority are used in series, execution is performed from right to left: e.g., $e^x \ln \sqrt{120} \rightarrow e^x \left\{ \ln \sqrt{120} \right\}$.
- Otherwise, execution is from left to right.
- * Compound functions are executed from right to left:

e.g., $\sin \cos^{-1}0.6 \rightarrow \sin (\cos^{-1}0.6)$.

* Everything contained within parentheses receives highest priority.

Ex.
$$2+3 \times (\log \sin 2\pi^2_{rad} + 6.8) = 22.07101691$$

Number of stacks

This unit features a memory known as a stack for the temporary storage of low priority numeric values and commands (functions, etc). The numeric value stack has eight levels, while the command stack has twenty. If a complex formula is employed that exceeds the stack space available, a stack error (Stk ERROR) message will appear on the display.

<u> </u>				

Computation modes

This unit features modes for manual computations, storing programs, and modes for general as well as statistical computations. The proper mode to suit computational requirements should be employed.

Operation modes

There are a total of three operation modes.

- 1. RUN mode
 - Graph production as well as manual computations and program executions.
- 2. WRT mode

Program storage and editing. (See Section 4.)

3. PCL mode

Deletion of stored programs. (See Section 4.)

Computation modes

There are a total of six computation modes which are employed according to the type of computation.

1. COMP mode

General computations, including functional computations.

2. Base-n mode

Binary, octal, decimal, hexadecimal conversion and computations, as well as logical operations. (See page 46.) Function computations and graph drawing cannot be performed.

3. SD1 mode

Standard deviation computation (single variable statistics). (See page 50.)

4. SD2 mode

For production of bar graph, line graph or normal distribution curve according to single variable statistical data. (See page 84.)

5. LR1 mode

Regression computation (paired variable statistics). (See page 52.)

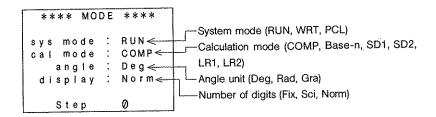

LR2 mode

For production of regression line graph according to paired variable statistical data. (See page 88.)

With so many modes available, computations should always be performed after confirming which mode is active.

* IMPORTANT: When the power of the unit is switched OFF (including auto power off), the current system mode is cancelled, and the unit will be set to the RUN mode when switched ON again. However, the calculation mode, number of decimal place setting (MODE 17 n), number of significant digits (MODE 18 n), and angle unit (Deg, Rad, Gra) will be retained in memory. The mode setting is displayed when the power of the unit is switched ON. Confirm whether the desired mode is set before performing calculations.

^{*} Computations are performed in the order of the highest computation priority first. Once a computation is executed, it is cleared from the stack.

Number of input/output digits and computation digits

● The allowable input/output range (number of digits) of this unit is 10 digits for a mantissa and 2 digits for an exponent. Computations, however, are internally performed with a range of 13 digits for a mantissa and 2 digits for an exponent.

Ex. 3×10°÷7=

3 EXP 5 ± 7 EXE

3 EXP 5 ⊕ 7 □ 42857 EXE

 4:	2	8	5	7	•	1	4	2	8	6	
 (d		1	4	2	8	5	7	1	4	

* Computation results greater than 10¹⁰ (10 billion) or less than 10⁻² (0.01) are automatically displayed in exponential form.

Ex. 123456789×9638=

123456789 ⊠ 9638 EXE

1.189876532 +12

Mantissa

Exponent

Once a computation is completed, the mantissa is rounded off to 10 digits and displayed. And the displayed mantissa can be used for the next computation.

Ex. 3×105÷7=

3 EXP 5 ÷ 7 EXE

☐ 42857 EXE

42857.14286 0.14286

Overflow and errors

If the computational range of the unit is exceeded, or incorrect inputs are made, an error message will appear on the display window and subsequent operation will be impossible. This is the error check function. The following operations will result in errors:

- (1) The answer, whether intermediate or final, or any value in memory exceeds the value of $\pm 9.999999999\times 10^{99}$.
- (2) An attempt is made to perform functional computations that exceed the input range. (See page 265.)
- (3) Improper operation during statistical computations. (Ex. Attempting to obtain \bar{x} or $x\sigma_n$ without data input.)
- (4) The capacity of the numeric value stack or the command stack is exceeded.
 - (Ex. Entering nineteen successive ☐ 's followed by ② ⊞ ③ ☑ ④)
- (5) Even though memory has not been expanded, a memory name such as A [2] is used. (See page 126 for details on memory.)
- (6) Input errors are made. (Ex. 5 ⊞ ⊞ 3 ExE)
- (7) When improper arguments are used in commands or functions that require arguments. (i.e. Input of an argument outside of the range of 0∼9 for Sci or Fix.)

The following error messages will be displayed for the operations noted above:

- (I)~(3) Ma ERROR
- (4) Stk ERROR
- (5) Mem ERROR
- (6) Syn ERROR
- (7) Arg ERROR

Besides these, there are an "Ne ERROR" (nesting error) and a "Go ERROR". These errors mainly occur when using programs. See page 105 or the Error Message Table on page 261.

^{*} Values are stored in memory with 13 digits for the mantissa and 2 digits for the exponent.

Number of input characters

This unit features a 127-step area for computation execution.

One function comprises one step. Each press of numeric or \boxdot , \boxdot , \bowtie and \boxdot keys comprise one step. Though such operations as \boxdot (\checkmark) (\checkmark) key) require two key operations, they actually comprise only one function and, therefore, only one step.

These steps can be confirmed using the cursor. With each press of the corse or key the cursor is moved one step.

Input characters are limited to 127-steps. Usually the cursor is represented by a blinking "_", but once the 122nd step is reached the cursor changes to a blinking "\"". If the "\"" appears during a computation, the computation should be divided at some point and performed in two parts.

* When numeric values or computation commands are input, they appear on the display window from the left. Computational results, however, are displayed from the right.

Graphic and text displays

This unit has a graph display for production of graphs, as well as a text display for production of formulas and commands. These two types of display contents are stored independently of each other.

Switching between graph and text displays is performed using the Get key. Each press of Get switches from the current type of display to the other.

Operations to clear the display depend upon the type of display being shown:

Graphs: SHIFT CIS EXE

Text: AC

Pressing the AC key causes a cleared text display to appear if pressed during a graph display.

Display registers

This unit has separate registers for storing text and graph displays. Both of these two registers are unaffected by key operations except for those related to their functions (calculations or AC key operation during text display; graph drawing, switching to text display by GAT after clearing graph display by GHFT CIS EXE).

Since the register stores the previous calculation results, they can be recalled. This is especially useful in the text mode for binary, octal, decimal, and hexadecimal conversions, as well as decimal and significant digit settings.

The following commands will produce previous calculation results:

• Lbl 🔘	• Deg	• Prog 🔾
• Dsz 🔘	• Rad	_
• Isz 🔘	• Gra	
• McI	• Fix 🔘	
Hex	• Sci 🔘	
• Dec	 Norm 	
• Bin	 Rnd 	
• Oct	• Scl	

Ex. Perform the calculation 123×456, and then clear the graph display.

* The SHIFT CIS EXE operation during graph display does not affect the calculation, so the previous calculation result appears on the display.

123×456	
	56088.
123×456	
٠.,	56088.
CIS	
	56088.
	123×456

A calculation result displayed as shown here is cleared to 0 by pressing AC, or if the power of the unit is switched OFF (including auto power off).

Corrections

- To make corrections in a formula that is being input, use the 🔄 and 🖎 keys to move to the position of the error and press the correct keys.
 - Ex. To change an input of 122 to 123:

11 [2]	2
⇔	
হো	

1	2 2	
1	22	
1	23	

Ex. To change an input of cos60 to sin60:

cos 6 0
sin

cos	60	
cos	60	
sin	<u>6</u> 0.	

- * If, after making corrections, input of the formula is complete, the answer can be obtained by pressing EXE. If, however, more is to be added to the formula, advance the cursor using the A key to the end of the formula for input.
- If an unnecessary character has been included in a formula, use the and keys to move to the position of the error and press the Each press of EL will delete one command (one step).
 - Ex. To correct an input of 369XX2 to 369X2:

3	6	9	X	X	2
C	5 1	(=)	٦n	DEL	1

369××2_	
369× <u>2</u>	

- If a character has been omitted from a formula, use the 🖨 and 🖨 keys to move to the position where the character should have been input, and press 🖫 followed by the 🕦 key. Press 🖫 🕦 and insertions can be subsequently performed as desired.
 - Ex. To correct an input of 2.362 to sin2.362:

2 3 6 =2
SHIFT INS
sin

	2	•	3	6	2	 				,	 		
	2		3	6	2	 							
_	[2]		3	6	2	 *******							
	S	i	n		2	3	6	2	 			 	

* When SHIT INS are pressed, the letter at the insertion position is surrounded by "[]" and blinks. As many letters and/or commands as desired can be inserted at this position until (), (), (), (), or () is pressed. This blinking [] is indicated by "[]" in the alphabet mode () key), while it is indicated by "[]" in the shift mode () letter at the insertion position is surrounded by ").

Memory

This unit contains 26 standard memories. Memory names are composed of the 26 letters of the alphabet. Numeric values with 13 digits for a mantissa and 2 digits for an exponent can be stored.

Ex. To store 123.45 in memory A:

Values are assigned to a memory using the + key followed by the memory name.

Ex. To store the sum of memory A+78.9 in memory B:

Ex. To add 74.12 to memory B:

● To check the contents of a memory, press the name of the memory to be checked followed by EXE.

● To clear the contents of a memory (make them 0), proceed as follows:

Ex. To clear the contents of memory A only:

O - ALPHA A EXE	
-----------------	--

		0.
_	 	

Ex. To clear the contents of all the memories:

SHIFT	Мс
EXE	

- To store the same numeric value to multiple memories, press suff followed by __ ([-] key).
- Ex. To store a value of 10 in memories A through J:

10		ALPHA	SHIFT	[~]	ALPHA	J
ΕX	E					

10→A~J_	
	10.

Memory expansion

Though there are 26 standard memories, they can be expanded by changing program storage steps to memory. Memory expansion is performed by converting 8 steps to one memory.

* See page 108 for information on the number of program steps.

Number of memories	26	27	28	 - 36	 76	 846
Number of steps	6566	6558	6550	 6486	 6166	 6

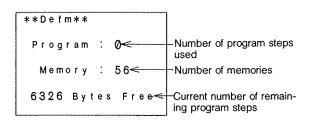

Momory is expanded in units of one. A maximum of 820 memories can be added for a maximum total of 846 (26 + 820). Expansion is performed by pressing MODE, followed by ⊡, a value representing the size of the expansion, and then EXE.

Ex. To expand the number of memories by 30 to bring the total to 56:

MODE **⊡** 30

Defm 30_

EXE

The number of steps used, number of memories and number of remaining steps are displayed. The number of remaining steps indicates the current unused area, and will differ according to the size of the program stored. To check the current number of memories, press $\frac{\text{MODE}}{\text{EXE}}$, followed by $\boxed{\cdot}$ and then $\boxed{\text{EXE}}$

MODE • EXE

Defm

Program : Ø

Memory : 56

6326 Bytes Free

To initialize the number of memories (to return the number to 26), enter a zero for the value in the memory expansion sequence outlined above.

MODE · O EXE

Defm

Program : Ø

Memory : 26

6566 Bytes Free

- * Though a maximum of 820 memories can be added, if a program has already been stored and the number of remaining steps is less than the desired expansion, an error will be generated. The size of the memory expansion must be equal to or less than the number of steps remaining.
- * The expansion procedure (MODE : expansion value) can also be stored as a program.

Using expanded memories

Expanded memories are used in the same manner as standard memories, and are referred to as Z [1], Z [2], etc. The letter Z followed by a value in brackets indicating the sequential position of the memory is used as the memory name. (Brackets are formed by ALPHA \odot for " [" and ALPHA \odot for "]".) After the number of memories has been expanded by 5, memories Z [1] through Z [5] are available.

The use of these memories is similar to that of a standard computer array, with a subscript being appended to the name. For more information concerning an array, see page 126.

Answer (Ans) function

This unit has an answer function that stores the result of the most recent computation. Once a numeric value or numeric formula is entered and EXE is pressed, the result (the answer in the case of the numeric formula) is stored by this function. To recall the stored value, press the Ans key.

When Ans is pressed, "Ans" will appear on the display, and can be used in this form in subsequent calculations.

* Hereinafter, Ans will be referred to as the Ans memory.

Ex. 123+456=579 789-579=210

1 2 3 + 4 5 6 EXE

7 8 9 - Ans EXE

123+456	
	579.
789-Ans	
	210.

Numeric values with 13 digits for a mantissa and 2 digits for an exponent can be stored in the Ans memory. The Ans memory is not erased even if the power of the unit is switched OFF. Each time EXE is pressed, the value in the Ans memory is replaced with the new value produced by the computation executed.

When a value is stored to another memory using the EXE key, that value is not stored in the Ans memory.

Ex. Perform computation 78+56=134, then store the value 123 to memory A:

78 H 5 6 EXE

Ans EXE ... Checking the content of ... Ans memory

1 2 3 - ALPHA A EXE

Ans EXE

78 + 56	
	134.
Ans	
	134.
123→A	
	123.
Ans	
	134.

The Ans memory can be used in the same manner as the other memories, thus making it possible to use it in computation formulas. In multiplication operations, the \boxtimes immediately before \sqsubseteq can be omitted.

Ex. $15 \times 3 = \underline{45}$ $78 \times 45 = \underline{23} = 3487$

1 5 X 3 EXE

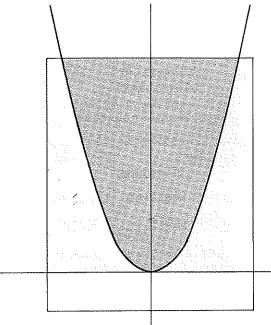

7 8 Ans — 2 3 EXE

15×3	
	45.
78 Ans - 23	
	3487.

Auto power off function

The power of the unit is automatically switched off approximately 6 minutes after the last key operation (except during program computations). Once this occurs, power can be restored either by switching the power of the unit OFF and then ON again, or by pressing the AC key. (Numeric values in the memories, programs or computation modes are unaffected when power is switched off.)

MANUAL COMPUTATIONS

2-1 BASIC COMPUTATIONS

Arithmetic operations

- Arithmetic operations are performed by pressing the keys in the same order as noted in the formula.
- For negative values, press before entering the value.

Example	Operation	Display
23+4.5-53=-25.5	23 ⊞ 4.5 ⊟ 53 EXE	-25.5
$56 \times (-12) \div (-2.5) = 268.8$	56 ⊠ (-) 12 ⊕ (-) 2.5 EXE	268.8

2-2 SPECIAL FUNCTIONS

■ Continuous computation function

Even if computations are concluded with the EXE key, the result obtained can be used for further computations. In this case, computations are performed with 10 digits for the mantissa which is displayed.

Ex.
$$3\times4=12$$
 Continuing $\div3.14=$

3 ≥ 4 EXE

(Continuing)

⊕ 3.14 EXE

3×4	
	12.
12.÷3.14	
3.821	656051

Ex. To compute $1 \div 3 \times 3$

1 ⊞ 3 ⊠ 3 EXE

1 ⊞ 3 EXE

(Continuing) ⊠ 3 EXE

1÷3×	3	
		1.
1÷3		
	0.333333	3333
0.33	33333333	×3
	0.999999	9999

This function can be used with memory and Type A functions $(x^2, x^{-1}, x!)$; see page 44), and +, -, x^y , $\sqrt[x]{}$, \cdots .

Ex. To store the result of 12X45 in memory C:

12 ⊠ 45 EXE

(Continuing) → ALPHA **G** EXE

12×45	
	540.
540.→C	
	540.

Ex. To square the result of 78÷6 (see page 44):

(Continuing) x2 EXE

78÷6	
	13.
13.2	
	169.

Replay function

● This function stores formulas that have been executed. After execution is complete pressing either the ➡ or ➡ key will display the formula executed.

Pressing will display the formula, with the cursor located under the first character.

Pressing will display the formula, with the cursor located at the space following the last character.

Then using , and to move the cursor, the formula can be checked and numeric values or commands can be changed for subsequent execution.

Ex.

123 ⊠ 456 E	ΚĖ
-------------	----

123×456

56088.

 \Rightarrow

123×456

* The formula appears after clearing the display.

EXE

123×456

56088.

⟨⊃

123×456_

Ex. 4.12×3.58+6.4=21.1496 4.12×3.58-7.1=7.6496

4.12 ⊠ 3.58 ⊞ 6.4 EXE

4.12×3.58+6.4 21.1496

♦

4.12×3.58+6.4_

4.12×3.58±6.4

☐ 7.1 EXE

4.12×3.58-7.1 7.6496 • If an error is generated during computation execution, an error check function eliminates the need to clear the error using AC and then restarting input from the beginning. Pressing either or will automatically move the cursor to the point in the formula that generated the error and display it.

Ex. When $14 \div 0 \times 2.3$ is mistakenly entered for $14 \div 10 \times 2.3$:

14 ⊕ 0 ⊠ 2.3 EXE

14÷0×2.3 Ma ERROR

Step

14÷0×2.3

Error generated here.

SHIFT INS 1 EXE

14÷10×2.3

3.22

- * As with the number of input characters (see page 20), the replay function can accept input up to 127 steps.
- * The replay function is cleared when the AC key is pressed, when power is switched OFF or when the mode is changed.

Input buffer recall function

● Unlike the replay function, the input buffer recall function can be used to recall a computation formula even after the AC key has been pressed (except in the file editor mode). This function is activated by entering MODE Ans.

Ex.

123 ⊠ 456 EXE

123X456

56088.

AC

⇔

123×456

MODE Ans

Multistatement function

 The multistatement function (using colons to separate formulas or statements) available in program computations can also be used for manual computations.

• The multistatement function allows formulas to be separated by colons to make consecutive, multiple statement computations possible.

• When EXE is pressed to execute a formula input using the multistatement format, the formula is executed in order from the beginning.

● Inputting "◢" (🗓) in place of the colon will display the computational result up to that point during execution.

123 → ALPHA A : 6.9 ⊠
ALPHA A SHIFT ⊿

ALPHA A ⊕ 3.2 EXE

123→A:6.9×A ₄ A÷3.2 848.7 — Disp —

The display halted by the \triangle command is represented with -Disp-.

EXE

* Even if "A" is not input at the end of a formula, the final result will be displayed.

* Consecutive computations using multistatements cannot be performed. 123×456: +5

L Invalid

2-3 FUNCTIONAL COMPUTATIONS

Angular measurement units

● The unit of angular measurement (degrees, radians, grads) is set by pressing MODE followed by a value from 4 through 6 and then EXE.

● The numeric value from 4 through 6 specifies degrees, radians and grads respectively.

 Once a unit of angular measurement is set, it remains in effect until a new unit is set. Settings are not cleared when power is switched OFF.

● The unit of angular measurement can be checked by pressing the leave the leaves the leaves the leaves the leaves the leavest leavest leavest leaves the leavest leav

● You cannot specify the unit of angular measurement (degrees, radians, grads) while the calculator is in the Base-n mode. Such specifications can only be made if you first exit the Base-n mode.

Example	Operation	Display .
Conversion of 4.25 rad to degrees	MODE 4 EXE 4.25 SHIFT MODE 5 EXE	243.5070629

2-4 BINARY, OCTAL, DECIMAL, HEXADECI-MAL COMPUTATIONS

● Binary, octal, decimal and hexadecimal computations, conversions and logical operations are performed in the Base-n mode (press MODE □).

The number system (2, 8, 10, 16) is set by respectively pressing Bin, Oct, Dec or Hex, followed by EXE.

● Number systems are specified for specific values by pressing SHIFT, then the number system designator (ⓑ, ☉, ⓓ or ♄), immediately followed by the value.

• General function computations cannot be performed in the Base-n mode.

 Only integers can be handled in the Base-n mode. If a computation produces a result that includes a decimal value, the decimal portion is cut off.

 Octal, decimal and hexadecimal computations can be handled up to 32 bits, while binary can be handled up to 16 bits.

Binary Up to 16 digits
Octal Up to 11 digits
Decimal Up to 10 digits
Hexadecimal Up to 8 digits

● The total range of numbers handled in this mode is 0, 1, 2, 3, 4, 5, 6, 7, 8, 9, A, B, C, D, E, F. If values not valid for the particular number system are used, attach the corresponding designator (b, o, d or h), or an error message will appear.

Valid values

Binary 0, 1

Octal 0, 1, 2, 3, 4, 5, 6, 7

Decimal 0, 1, 2, 3, 4, 5, 6, 7, 8, 9

Hexadecimal 0, 1, 2, 3, 4, 5, 6, 7, 8, 9, A, B, C, D, E, F

 Negative numbers in binary, octal and hexadecimal are expressed as two's complements.

• To distinguish the A, B, C, D, E, F used in the hexadecimal system from standard letters they appear as: A, B, C, D, E, F. • Computation range (in Base-n mode)

Binary Positive: 1111111111111 $\ge x \ge 0$

Decimal Positive: $2147483647 \ge x \ge 0$

Negative: $-1 \ge x \ge -2147483648$

Hexadecimal Positive: $7FFFFFF \ge x \ge 0$

Negative: FFFFFFF $\geq x \geq 80000000$

● You cannot specify the unit of angular measurement (degrees, radians, grads) or the display format (Fix, Sci) while the calculator is in the Base-n mode. Such specifications can only be made if you first exit the Base-n mode.

2-5 STATISTICAL COMPUTATIONS

Standard deviation

- Standard deviation computations are performed in the SD1 mode. (Press MODE ☑.)
- Before beginning computations, the statistical memories are cleared by pressing SHIFT followed by Sci (AC) key) and then EXE.
- Individual data is input using DT (Key).
- Multiple data of the same value can be input either by repeatedly pressing DT or by entering the data, pressing SHIFT, followed by :, that represents the number of times the data is repeated, and then DT.
- Standard deviation

$$\sigma_n = \sqrt{\frac{\sum\limits_{i=1}^{n} (x_i - \bar{x})^2}{n}} = \sqrt{\frac{\sum x^2 - (\sum x)^2/n}{n}}$$

Using the entire data of a finite population to determine the standard deviation for the population.

$$\sigma_{n-1} = \sqrt{\frac{\sum_{i=1}^{n} (x_i - \bar{x})^2}{n-1}} = \sqrt{\frac{\sum x^2 - (\sum x)^2/n}{n-1}}$$

Using sample data for a population to determine the standard deviation for the population.

Mean

$$\bar{x} = \frac{\sum_{i=1}^{n} x_i}{n} = \frac{\sum x}{n}$$

* The values for n, Σx , and Σx^2 are stored in memories W, V, and U respectively, and can be obtained by pressing ALPHA followed by the memory name and then $\overline{\text{EXE}}$ (i.e. ALPHA \square $\overline{\text{EXE}}$).

^{*} Erroneous data clearing/correction I (correct data operation: 51 DT)

¹⁾ If 50 DT is entered, enter correct data after pressing CL (xy key).

② If 49 DT was input a number of entries previously, enter correct data after pressing 49 CL.

- * Erroneous data clearing/correction II (correct data operation: 130 SHFT II 31 II II
- 1) If 120 shift is entered, enter correct data after pressing AC.
- ② If 120 SHIFT : 31 is entered, enter correct data after pressing AC.
- (3) If 120 SHIFT : 30 DT is entered, enter correct data after pressing CL.
- 4 If 120 SHFT : 30 DT was entered previously, enter correct data after pressing 120 SHFT : 30 CL.

Regression computation

- Before beginning computations, the tabulation memories are cleared by pressing SHIFT followed by ScI and then EXE.
- Individual data are entered as x data SHIFT y data DT.
- Multiple data of the same value can be entered by repeatedly pressing □T. This operation can also be performed by entering x data □ y data □T □ followed by a value representing the number of times the data is repeated, and then □T.
- If only x data is repeated (x data having the same value), enter y data y
- If only y data is repeated (y data having the same value), enter x data \overline{DT} or x data \overline{SHFF} $\overline{\Box}$ followed by a value representing the total number of times the data is repeated, and then \overline{DT} .
- The regression formula is y = A + Bx, and constant term A and regression coefficient B are computed using the following formulas:

Regression coefficient of regression formula

$$B = \frac{n \cdot \sum xy - \sum x \cdot \sum y}{n \cdot \sum x^2 - (\sum x)^2}$$

Constant term of regression formula

$$A = \frac{\sum y - B \cdot \sum x}{n}$$

- ullet Estimated values \hat{x} and \hat{y} based on the regression formula can be computed.
- ullet The correlation coefficient r for input data can be computed using the following formula:

$$r = \frac{n \cdot \sum xy - \sum x \cdot \sum y}{\sqrt{|n \cdot \sum x^2 - (\sum x)^2| \cdot |n \cdot \sum y^2 - (\sum y)^2|}}$$

* The values for n, $\sum x$, $\sum x^2$, $\sum xy$, $\sum y$, and $\sum y^2$ are stored in memories W, V, U, R, Q and P respectively, and can be obtained by pressing ALPHA followed by the memory name and then EXE (i.e. ALPHA WE EXE).

▲ Logarithmic regression

- The regression formula is $y = A + B \cdot \ln x$. Enter the x data as the logarithm (In) of x, and the y data inputs the same as that for linear regression.
- The same operation as with linear regression can be used to obtain the regression coefficient and for making corrections. To obtain the estimated value \hat{y} , in x shift \hat{y} EXE is used, and to obtain estimated value \hat{x} , y shift \hat{z} EXE shift \hat{z} Ans EXE is used.

Furthermore, $\sum x$, $\sum x^2$, and $\sum xy$ are obtained as $\sum \ln x$, $\sum (\ln x)^2$, and $\sum \ln xy$ respectively.

Power regression

• The regression formula is $y = A \cdot x^{B}(\ln y = \ln A + B \ln x)$. Enter both data x and y as logarithms (In).

Correction is performed the same as in linear regression. Constant term A is obtained by SHIFT e^x SHIFT A EXE, estimated value \hat{y} is obtained by n X SHIFT \hat{y} EXE SHIFT e^x Ans EXE, and estimated value \hat{x} is obtained by n Y SHIFT \hat{y} EXE SHIFT e^x Ans EXE. Σx , Σx^2 , Σy , Σy^2 and Σxy are obtained by $\Sigma \ln x$, $\Sigma (\ln x)^2$, $\Sigma \ln y$, $\Sigma (\ln y)^2$ and $\Sigma \ln x \cdot \ln y$ respectively.

The graph function of this unit makes it possible to produce a wide variety of function and statistical graphs quickly and easily on a 95 \times 63 dot display. (Upmost and leftmost lines are not used.)

Besides the built-in function graphs, a generous selection of functions can also be input for graphic representation.

Graph commands can be used manually or in programs, but here all examples will be centered around manual operations. Programmed graphs are identical to those produced manually, and details can be found on page 134.

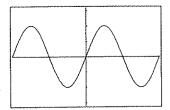

* Some of keys used for the operation examples in this manual show alphabetic character key markings. On the actual unit, alphabetic characters are marked under the keys by which they are represented.

3-1 BUILT-IN FUNCTION GRAPHS

The COMP mode of the RUN mode should be used when graphing functions. Some graphs can be produced in the SD and LR modes, but certain graphs cannot be produced in these modes. The Base-n mode cannot be used for graphs. This unit contains a total of 20 built-in graphs making it possible to produce the graphs of basic functions.

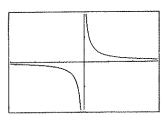

Any time a built-in graph is executed, the ranges (see page 61) are automatically set to their optimum values, and any graph previously on the display is cleared.

Ex. 1) Sine curve

Ex. 2)
$$y = \frac{1}{x}$$
 graph

Graph x^{-1} EXE

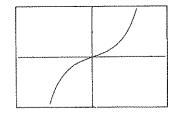

Overwriting built-in function graphs

Two or more different built-in function graphs can be written together on the same display. Since the range for the first graph is automatically set, all subsequent graphs on the same display are produced according to the range of the first graph.

The first graph is produced by using the previously mentioned operation [Function key] [EXE].

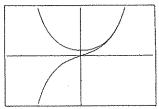

Ex. Overwrite the graph for $y = \cosh x$ on the graph for $y = \sinh x$. First, draw the graph for $y = \sinh x$.

Graph hyp sin EXE

Next, draw the graph for $y = \cosh x$ without changing the existing range.

Graph hyp cos ALPHA X EXE

(Note)

Built-in function graphs cannot be used in multistatements (see page 38) and cannot be written into programs.

3-2 USER GENERATED GRAPHS

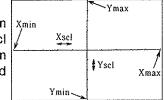

Built-in function graphs can also be used in combination with each other. Graphing a formula such as $y=2x^2+3x-5$ makes it possible to visually represent the solution.

Unlike built-in functions, the ranges of user generated graphs are not set automatically, so graphs produced outside of the display range do not appear on the display.

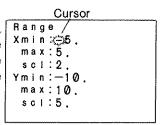

Ranges

The ranges of the x and y-axes, as well as the scale (distance between points) for both axes can be set or checked using the Range key.

● Ranges contents
Ranges consist of Xmin (x-axis minimum value), Xmax (x-axis maximum value), Xscl (x-axis scale), Ymin (y-axis minimum value), Ymax (y-axis maximum value), and Yscl (y-axis scale).

● Range display
Ranges are displayed as shown on the right when the Range key is pressed. The range value at the cursor position can be changed.

Values shown here are only an example.
Actual values may differ.

Range setting

Range settings are made from the current cursor position and proceed in the order of Xmin→Xmax→Xscl→Ymin→Ymax→Yscl. Input a numeric value at the cursor position and then press EXE. Any value input while the cursor is at the first (extreme left) digit of the displayed value will replace the displayed value when EXE is pressed.

If the 🖨 key is used to move the cursor to the second or subsequent digit of the displayed value, only the portion of the displayed value starting from the cursor position will be affected by the new input when EXE is pressed.

Here, let's try changing the currently set range values to those listed below:

 $Xmin \rightarrow 0$ $Ymin \rightarrow -5$ $Xmax \rightarrow 5$ $Ymax \rightarrow 15$ $Xscl \rightarrow 1$ $Yscl \rightarrow 5$

(1) Input 0 for Xmin.

0 EXE

Range Xmin: 0 max: 5; sci: 2. Ymin: -10. max: 10 sci: 5.

② The Xmax value is the same, so simply press EXE.

Range Xmin:0 max:5. sci:2. Ymin:-10. max:10 sci:5.

③ Input 1 for Xscl.

1 EXE

Range

Xmin: 0

max: 5.

sci: 1

Ymin = 10

sci: 5.

4 To change Ymin to -5, use the 5 key to move the cursor one digit to the right and input 5.

⇒ 5 EXE

⑤ To change Ymax to 15, use the 🗗 key to move the cursor one digit to the right and input 5.

⇒ 5 EXE

Range Xmin: 0 max: 5. scl: 1 Ymin: -5 max: 15 scl: 5,

⑥ The YscI value is the same, so simply press EXE.

Once all settings are complete, the display that was shown before pressing the $\[mathbb{R}\]$ key is retrieved.

Press the Range key again to confirm whether settings are correct.

Range

Range Xmin: 0: max: 5. scl: 1. Ymin: -5. max: 15. scl: 5.

The ① and ③ keys can be used to move the cursor from line to line in the range display without affecting the range values. The cursor can only be moved upwards as far as Xmin, and downwards as far as Yscl. Press to return to the display that was shown before entering the range display.

- * The input range for graph ranges is 0 or $1\times10^{-96} \le |x| < 1\times10^{99}$.
- * Only numeric value keys from ① through ③, ①, EXP, ①, ②, ③, ①, 3, and Renge can be used during range display. Other key operation is ignored.

(Use the (-) key for negative value input.)

* To completely change an existing range setting, ensure that the cursor is located at the first digit (all the way to the left) of the displayed value. If the cursor has been moved to another digit of the value, only the portion of the value from the cursor position (to the right) will be changed. The portion of the value to the left of the cursor will remain unchanged.

Ex.

⇔

3

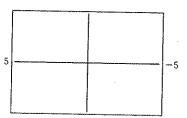

2 5	
-25	
-35	
-3	

- * Values up to nine significant digits can be input.

 Values less than 10⁻² and equal to or greater than 10⁸ are displayed with a 6-digit mantissa (including negative sign) and a 2-digit exponent.
- * If input is improper (outside the allowable calculation range or inputting only a negative sign), the existing value will remain unchanged. (The improper input, however, will be temporarily displayed.)
- * Inputting 0 for XscI or YscI does not set any scale.
- * Inputting a maximum value that is less than the minimum value will reverse the respective axis.

Ex. Xmin: 5

Xmax: −5

- * If the maximum and minimum values of an axis are equal, an error (Ma ERROR) will be generated when an attempt is made to produce a graph.
- *When a range setting is used that does not allow display of the axes, the scale for the y-axis is indicated on either the left or right edge of the display, while that for the x-axis is indicated on either the top or bottom edge. (In both cases, the location of the scale is the edge which is closest to the origin (0, 0)).
- * When range values are changed (reset), the graph display is cleared and the newly set axes only are displayed.
- * Range settings may cause irregular scale spacing.
- * If the range is set too wide, the graph produced may not fit on the display.
- * Points of deflection sometimes exceed the capabilities of the display with graphs that change drastically as they approach the point of deflection.
- * An Ma ERROR may be generated when a range value is specified that exceeds the allowable range.

Ex. Xmin $9._{E}99$ Xmax $9.9_{E}99$ Xscl $1._{E}99 \Rightarrow$ Falls outside of range.

- * An Ma ERROR is generated when ranges are extremely narrow.
- Range reset

Range values are reset to their initial values by pressing SHFT DEL during range display.

Range (Not required when range display is already being shown.)

SHIFT DEL

Range

Xmin:-4.7

max:4.7

sci:1.

Ymin:-3.1

max:3.1

sci:1.

(Reference)

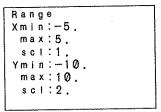

Range settings are performed within programs using the following format:

Range Xmin value, Xmax value, Xscl value, Ymin value, Ymax value, Yscl value

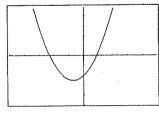

Up to six data items are programmed after the flange command. When less than six items are programmed, range setting is performed in the order from the beginning of the above format.

User generated function graphs

After performing range settings, user generated graphs can be drawn simply by entering the function (formula) after pressing [Graph]. Here, let's try drawing a graph for $y=2x^2+3x-4$. Set the ranges to the values shown below.

Input the functional formula after pressing the Graph key.

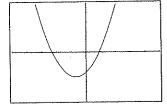

The result produces a visual representation of the formula.

Function graph overwrite

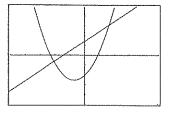

Two or more function graphs can be overwritten which makes it easy to determine intersection points and solutions that satisfy all the equations.

Ex. Here, let's find the intersection points of the previously used $y=2x^2+3x-4$ and y=2x+3.

First, clear the graph screen in preparation for the first graph.

Next, overwrite the graph for y=2x+3.

In this way it can be easily seen that there are two intersections for the two function graphs. The approximate coordinates for these two intersections can be found using the trace function described in the following section.

* Be sure to input variable X (ALPHA III) into the function when using built-in graphs for overwrite.

If variable X is not included in the second formula, the second graph is produced after clearing the first graph.

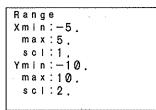

Trace function

The pointer (blinking dot) can be moved using the cursor keys (\bigcirc \bigcirc) to determine the x and y coordinates of any point on a graph.

After a graph is produced on the display, press shift trace and the point will appear at the extreme left plot of the graph. The x-coordinate value (X=...) will appear on the bottom line of the display. The pointer can be moved using the \Box and \Box cursor keys, and the x-coordinate value changes as the pointer moves. To change from the x-coordinate to the y-coordinate value, press shift $x \to y$. The displayed coordinate switches between x and y with each press of shift $x \to y$.

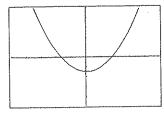

Ex. Determine the points of intersection of the graphs for $y = x^2 - 3$ and y = -x + 2.

The range values should be set as follows:

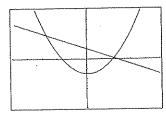

First, draw the graph for $y=x^2-3$.

Graph ALPHA X x² = 3 EXE

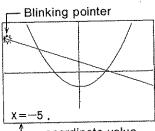

Next, draw the graph for y=-x+2.

Graph (-) ALPHA X + 2 EXE

Finally, let's use the trace function.

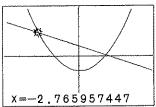

SHIFT Trace

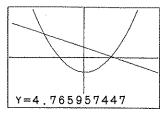

Lx-coordinate value

The pointer appears at the extreme left plot of the graph. The skey moves the pointer to the right along the graph. Each press of smoves the pointer one point, while holding it down causes continuous movement.

(Hold down)

SHIFT X-Y

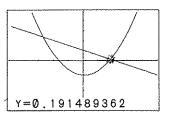

In this way, it can be determined that the coordinates of the first intersection are x=-2.765957447 and y=4.765957447.

* The pointer does not move at the fixed distance because the distance is located along the dots of the display. Therefore, the x-y coordinates for the point of intersection are approximate values.

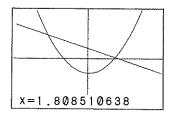

Similarly, press to move the pointer to the next point of intersection.

፟ ~

This time, press $x \to y$ to display the x-coordinate value.

SHIFT X-Y

Using the operations outlined above, the approximate x-y coordinates for points along graphs can be obtained.

- * The trace function can only be used immediately after a graph is drawn. This function cannot be used if other calculations or operations (except [MOSS], Range], or [G-T]) have been employed after a graph has been drawn.
- * The x-y coordinate values at the bottom of the display consist of a 10-digit mantissa or a 5-digit mantissa plus a 2-digit exponent.

- * The trace function cannot be written into a program.
- * The trace function can be used during a "-DISP-" display.
- * When the format Graph formula Graph formula EXE is executed and a graph is drawn by pressing EXE directly after executing the trace function during halt status, the previous coordinate value remains on the display. After the trace function is executed and the text display is brought up using the G-T key, pressing EXE causes the next graph to appear and the coordinate value to clear.

Examine the above using Graph ALPHA X 2 SHIFT A Graph 2 ALPHA X + 5

Plot function

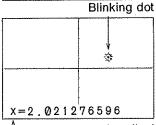

The plot function is used to mark a point on the screen of a graph display. The point can be moved left, right, up and down using the cursor keys, and the coordinates for the graph displayed can be read. Two points can also be connected by a straight line (see Line function, page 73).

Press $\widehat{\text{SHIFT}}$ $\widehat{\text{Plot}}$ and specify the x and y-coordinates after the "Plot" message.

Ex. Plot a point at x=2 and y=2 on the axes created by the following range values:

Range
Xmin:-5.
max:5.
scl:1.
Ymin:-10.
max:10.
scl:2.

SHIFT Plot 2 SHIFT 12 EXE

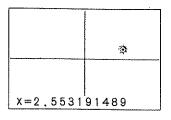

[↑]x-coordinate value display

The blinking pointer is positioned at the specified coordinates.

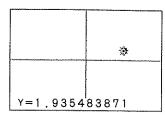

* Due to limitations caused by the resolution of the display, the actual position of the pointer can only be approximate.

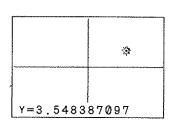

The pointer can be moved left, right, up, and down using the cursor keys. The current position of the pointer is always shown at the bottom of the display.

To find the y-coordinate value:

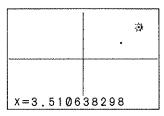

SHIFT X → Y

Now, inputting a new coordinate value causes the new pointer to blink without clearing the present pointer.

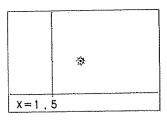

SHIFT Plot 3.5 SHIFT . 6.5 EXE

If x-y coordinates are not specified for the plot function, the pointer appears at the center of the screen. Set the following range values:

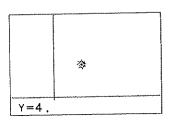

-	Range
	Xmin:-2.
	max:5.
	scl:1.
	Ymin:-2.
ļ	max:10.
-	sci:2.

SHIFT Plot EXE

To find the Y-coordinate value:

SHIFT X-Y

- * Attempting to plot a point outside of the preset range is disregarded.
- * The x and y-coordinates of the pointer used in the plot function are respectively stored in the X memory and Y memory.
- * A blinking pointer becomes a fixed point (not blinking) when a new pointer is created.

Line function

The line function makes it possible to connect two points (including the blinking pointer) created with the plot function with a straight line. With this function, user generated lines can be added to graphs to make them easier to read.

Ex. Draw perpendiculars from point (2,0) on the x-axis to its intersection with the graph for y=3x. Then draw a line from the point of intersection to the y-axis.

The range values for the graph are as follows:

Range
Xmin:-2.
max:5.
sci:1.
Ymin:-2.
max:10.
sci:2.

Clear the graph display and draw the graph for y=3x.

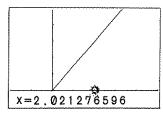

SHIFT CIS EXE

Graph 3 ALPHA EXE

Next, use the plot function to locate a point at (2,0).

SHIFT Plot 2 SHIFT J 0 EXE

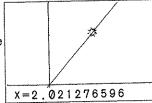

Now plot a point at (2,0) again and use the cursor key (\bigcirc) to move the pointer up to the point on the graph (y=3x).

SHIFT PIOT 2 SHIFT 1 0 EXE

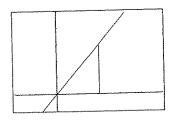

Ŷ~Ŷ

(Move the pointer up to the point on the graph for y=3x.)

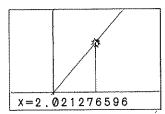

Draw a line using the line function.

SHIFT Line EXE

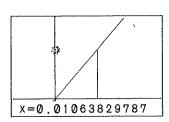

Next, a perpendicular will be drawn from the same point on the graph to the y-axis. First, plot the point on the graph and use the cursor key (\bigcirc) to move the pointer to the y-axis. This can be accomplished using Plot X, Y since the x-y coordinates of the point on the graph are stored in the X and Y memories.

SHIFT Plot ALPHA X SHIFT

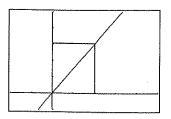

♦ ~ ♦

(Move the pointer to the y-axis.)

SHIFT Line EXE

* The line function can only be used to draw lines between the blinking pointer and a fixed point created using the plot function.

Factor function

The factor function is used to magnify or reduce the range of a graph centered around the blinking pointer provided with the plot function or trace function.

For magnification, the minimum value and maximum value of the range are multiplied by 1/n. For reduction, they are multiplied by n.

Operation

SHIFT Factor m SHIFT , n EXEx is magnified m times and y is magnified n times centered around the pointer.

SHIFT Factor n EXE $\cdots x$ and y are both magnified n times centered around the pointer.

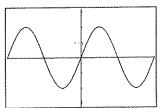

The graph display is cleared when the factor function is executed because of changes in the range values.

Ex. After setting the range values specified below, magnify the graph for $y=\sin x$ centered on the origin.

Range
Xmin:-360.
max:360.
sci:180.
Ymin:-1.6
max:1.6
sci:0.5

Draw the graph for $y=\sin x$ after setting the range values.

Graph sin ALPHA X EXE

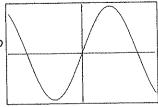

Now use the plot function to blink the pointer at the origin of the graph and then use the factor function to magnify the graph 1.5 times.

SHIFT Plot : SHIFT Factor 1.5 :

Graph Sin ALPHA X EXE

* The multistatement function is used to produce the graph in a single step.

The following shows the resulting range values:

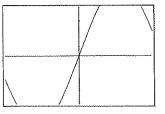

Range Xmin: -240. max: 240. sci: 180. Ymin: -1.06666667 max: 1.06666667 sci: 0.5

This indicates that the range values for the x and y-axes are equal to 1/1.5 of their original values.

Now let's try magnifying the graph another 1.5 times.

This time, it is not necessary to input any further commands. The existing graph is magnified by simply pressing [EXE]. Since the original magnification was accomplished using the multistatement function, the replay function becomes operational.

EXE

Now the graph is so large that little of it remains on the display. Let's try to reduce the graph to half its present size to make it more manageable.

The replay function is used to change the magnification value from 1.5 to 0.5.

⇨

Plot:Factor 1.5 :Graph Y=sin X

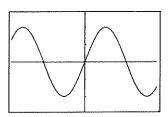

Plot : Factor 1.5 : Graph Y=sin X

0

Plot:Factor 0_5 :Graph Y=sin X

Now execute the function.

EXE

The following display shows the new range values:

Range

Range

Xmin: -320.

max: 320.

scl: 180.

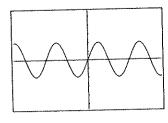

Ymin: -1.42222223

max: 1.42222221

sci: 0.5

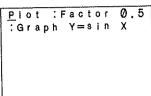

To reduce the graph by half again:

EXE

Now let's double the x-axis and increase the y-axis by 1.5 times.

⇔

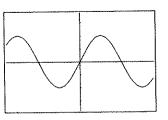

⇔ ⇔ SHIFT INS

SHIFT INS 1

Now execute the function.

EXE

Using the operations outlined in this section, graphs can be magnified or reduced. In the examples given here, the graphs were magnified and reduced centered around the origin, but any pointer on the display can be used as a central point for magnification and reduction.

Instant factor function

The instant factor function can be used to quickly magnify the size of a graph by 2^n or reduce it by $1/2^n$. The change in size is centered at the pointer when it is displayed, and at the center of the graph when the pointer is not displayed.

Operation

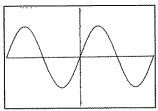

SHIFT \boxtimes ... 2X magnification in both x and y directions. Pressing shift \boxtimes again magnifies by 2^2 or 4X, and a third press magnifies by 2^3 or 8X.

SHIFT \oplus ... 1/2 reduction in both x and y directions. Pressing SHIFT \oplus again reduces by $1/2^2$ or 1/4, and a third press reduces by $1/2^3$ or 1/8.

Since range contents are switched to their inverse proportions, the graphic display is cleared each time the instant factor function is executed.

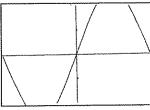

Ex. Graph $y=\cos x$ using the built-in function, and change the size by 2X and 1/2.

Graph sin EXE

Now magnify the graph 2 X at the center of the display.

SHIFT X

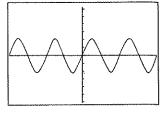

Next, reduce the original $y=\cos x$ graph by 1/2.

SHFT

☐ (Returns to original graph.)

SHIFT ∻

In the above examples, the changes in the graph size were performed at the center of the display. If the pointer is shown on the display, the magnification/reduction is applied centered at the pointer.

3-3 GRAPH FUNCTION APPLICATIONS

Even complex equations can be graphically represented. A number of graphs for the equations will be presented in this section.

Ex. 1) Draw the graph for the third degree equation, $y=x^3-9x^2+27x+50$.

3-4 SINGLE VARIABLE STATISTICAL GRAPHS

- Single variable statistical graphs are drawn in the SD2 mode (SHIFT MODE 区).
- Bar graphs, line graphs, and normal distribution curves can be produced as single variable statistical graphs.
- Function graphs are also possible in the SD2 mode, so graphs of theoretical values and graphs of actual values can be overwritten.
 - * Abs and ₹ cannot be used in the SD2 mode.
- Number of data is determined by expanding memories.
- Graphs are drawn with the x-coordinate as the data range and the ycoordinate as the number of items (frequency) of each data.
- The DT key (☑) is used for data input.
- The CL key (z) is used for data correction.

Drawing single variable statistical graphs

- Procedure
- ① Specify the SD2 mode (SHIFT MODE ⋈).
- 2 Set the range values (Range).
- ③ Expand the memory in accordance with the number of bars ($\underbrace{\text{MODE}} \ \boxdot \ n$
- 4 Clear the statistical memories (SHIFT ScI EXE).
- ⑤ Input data (Data □T (💯)).
- 6 Draw the graph.
 - Bar graph Graph EXE

 - * Data input method in step 5 is the same as that for standard deviation computations (see page 50).

Ex. Use the following data to draw a ranked graph.

Rank No.	Rank	Frequency
1	0	1
2	10	3
3	20	2
4	30	2
5	40	3
6	50	5
7	60	6
8	70	8
9	80	15
10	90	9
11	100	2

Perform graph preparation in accordance with the following procedure:

- . (1) Specify the SD2 mode (SHIFT MODE X).
- ② Set the range values.

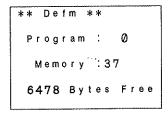

The highest value to be plotted on the x-axis is 100, but for graphing purposes the maximum value (Xmax) is set at 110. (The general rule is that the minimum value should be equal to or greater than the minimum range value and the maximum value should be less than the maximum range value, so here we set the x-axis ranges to 0 through 110.)

Ymax value is set to 20 for the y-axis because the maximum frequency is 15.

Ran	g	e						
X m i	n	:	0					
m a	X	:	1	1	0			
s c	1	:	1	0				
Y m i	r:	:	0					
m a	X	;	2	0				
s c	1	;	2					

③ Since the number of bars is $11(0\sim9, 10\sim19, 20\sim29...100\sim109)$ expand memories by 11.

MODE 11 EXE

4 Clear the statistical memory.

SHIFT SCI EXE

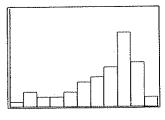

⑤ Input the data.

 $0 \,\, \square \overline{1} \,\, 10 \,\, \square \overline{1} \,\, \square \overline{1} \,\, 20 \,\, \square \overline{1} \,\, \square \overline{1} \,\, 30 \,\, \square \overline{1} \,\, \square \overline{1} \,\, 40 \,\, \square \overline{1} \,\, \square \overline{1}$

50 SHIFT ; 5 DT 60 SHIFT ; 6 DT 70 SHIFT ; 8 DT

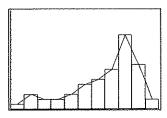

- 80 SHIFT : 15 DT 90 SHIFT : 9 DT 100 DT DT
- 6 First, draw a bar graph.

Graph EXE

Next, overwrite a line graph.

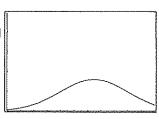

Graph SHIFT Line EXE

• Finally, draw a normal distribution curve. Since the *y*-axis value is relatively small when compared with the bar and line graphs, the same range values cannot be used. Change the range values to those shown below.

Graph SHIFT Line 1 EXE

Inputting the number 1 causes a normal distribution curve to be drawn.

(Summary)

- Be sure to expand the memory in accordance with the number of bars.

 A Mem-error is generated if memory expansion is not performed.
- If the number of expanded memories is changed during data input, the number of data divisions also changes, thus making it impossible to produce a proper graph.
- When a value that exceeds the preset ranges is input, it is input to the statistical memory, but not into the graph memory.
- When more data than the preset *y*-axis range is input, the bar graph is drawn to the upper limit of the display, and the points outside the range cannot be connected.
- The formula used for normal distribution curves is:

$$y = \frac{1}{\sqrt{2\pi} \sigma} e^{-\frac{(x-m)^2}{2\sigma^2}}$$

- * Keyboard designation of σ is $x \sigma n$. m is \bar{x} .
- After a bar or line graph is executed, "done" is displayed in the text display.

3-5 PAIRED VARIABLE STATISTICAL GRAPHS

- Paired variable graphs are drawn in the LR2 mode (SHFT MODE 🖹).
- Paired variable graphs can be drawn as regression lines.
- Standard function graphs can also be drawn in the LR2 mode, so theoretical graphs, data distribution and regression line graphs can be overwritten.
- After data input in the LR2 mode, points are displayed immediately, and data is input to the statistical memory.
- When a value that exceeds the preset range is input, it is input to the statistical memory, the point is not displayed.
- Data is input using the $\boxed{\text{DT}}$ (\boxed{x}) key in the following format: x data $\boxed{\text{SHFT}}$ y data $\boxed{\text{SHFT}}$ y data $\boxed{\text{SHFT}}$ y data $\boxed{\text{DT}}$.
- The CL () key is used to edit data after input is complete, but points that are produced on the display are not cleared. (Point appears even when data is corrected by the CL key).
- Points on the display cannot be retrieved if the display is cleared (SHIFT CIS EXE).

Drawing paired variable statistical graphs

- Procedure
- 1) Specify the LR2 mode (SHIFT MODE ±).
- 2 Set the range values (Range).
- (3) Clear the statistical memory (SHIFT Soil EXE).
- 4 Input data (x data y data y data y frequency y.
- (5) Draw the graph (Graph SHIFT Line 1 EXE).
 - * Data input method in step 4 is the same as that for Regression computation (Page 52).
 - Ex. Perform linear regression on the following data and draw a regression line graph.

_	_
x_i	y_i
9	-2
- 5	1
-3	2 3
1	1
4	5
7	8

- (1) Specify the LR2 mode (SHIFT MODE ±).
- ② Set the range values to those shown in the table.

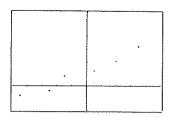

Range
Xmin:-10.
max:10.
sci:2.
Ymin:-5.
max:15.
sci:5.

- * According to the general rule of the x-axis range values, the values for x are: $-10 \le x < 10$.
- ③ Clear the statistical memories.

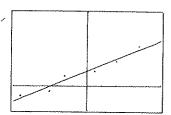

SHIFT ScI EXE

4 Input the data.

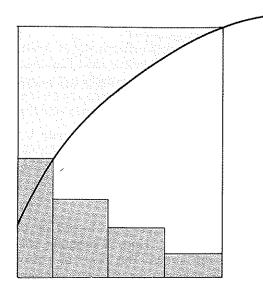

⑤ Draw the graph.

- * When data is input that is outside of the preset range values, a point does not appear.
- * An Ma ERROR is generated when there is no data input and the following key operation is performed: Graph SHIFT Line 1 EXE.

4. PROGRAM COMPUTATIONS

4-1 WHAT IS A PROGRAM?

This unit has a built-in program feature that facilitates repeat computations. The program feature is used for the consecutive execution of formulas in the same way as the "multistatement" feature is used in manual computations. Programs will be discussed here with the aid of illustrative examples.

EXAMPLE:

Find the surface area and volume of a regular octahedron when the length of one side is given.

Length of one side (A)	Surfac	e area (S)	Volu	ıme (V)
10cm	() cm²	()cm³
7	()	()
15	()	()

^{*} Fill in the parentheses.

(1) Formulas

For a surface area S, volume V and one side A, S and V for a regular octahedron are defined as:

$$S=2\sqrt{3}A^{2}$$
 $V=\frac{\sqrt{2}}{3}A^{3}$

(2) Programming

Creating a program based on computation formulas is known as "programming". Here a program will be created based upon the formulas given above. The basis of a program is manual computation, so first of all, consider the operational method used for manual computation.

Surface area (S): 2 2 7 3 Numeric value A x2 EXE

In the above example, numeric value A is used twice, so it should make sense to store it in memory A before the computations.

Numeric value A
$$\rightarrow$$
 ALPHA \bigcirc EXE 2 \bigcirc 3 \bigcirc ALPHA \bigcirc 2 \bigcirc EXE \bigcirc S \bigcirc 2 \bigcirc 3 \bigcirc ALPHA \bigcirc 2 \bigcirc 3 \bigcirc EXE \bigcirc V

With this unit, the operations performed for manual computations can be used as they are in a program. Once program execution starts, it will continue in order without stopping. Therefore, commands are required to request the input of data and to display results. The command to request data input is "?", while that to display results is "".

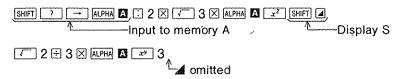

A "?" within a program will cause execution to stop temporarily and a "?" to appear on the display as the unit waits for data input. This command cannot be used independently, and is used together with — as " [3] — memory name". To store a numeric value in memory A, for example:

?→A

When "?" is displayed, calculation commands and numeric values can be input within 111 steps.

The "\[\textstyle{A}\]" command causes program execution to stop temporarily and the latest formula result or alphanumeric characters and symbols (see page 131) to be displayed. This command is used to mark positions in formulas where results are to be displayed. Since programs are ended and their final results displayed automatically, this command can be omitted at the end of a program. However, if the Base-n mode is specified for base conversion during a program, do not omit the final "\[\textstyle{A}\]". Here these two commands will be used in the previously presented pro-

Here these two commands will be used in the previously presented procedure:

Now the program is complete.

3 Program storage

The storage of programs is performed in the WRT mode which is specified by pressing $\boxed{\mathbb{Z}}$.

Operation

MODE 2

Display

							d			:		W	P	T			
	C	a	ŧ		m	0	d	е		:		С	0	M	Ρ		
				а	n	g	*	е		:		D	e	g			
		ď	ì	s	p	1	а	у		:		Ν	0	ŗ	m		
ı		6	5	6	6		В	y	ŧ	9	s		F	f	ę	Θ	
								•									
		P	t	0	g	į	Ö	1	2	3	4	5	6	7	8	9	

When MODE 2 are pressed, the system mode changes to the WRT mode. Then, the number of remaining steps (see page 108) is indicated. The number of remaining steps is decreased when programs are input or when memories are expanded. If no programs have been input and the number of memories equals 26 (the number of memories at initialization), the number of usable steps should equal 6566.

The larger figures located below indicate the program areas (see page 110). If the letters "Prog" are followed by the numbers 0 through 9, it indicates that there are no programs stored in areas P0 through P9. The blinking zero here indicates the current program area is P0.

Areas into which programs have already been stored are indicated by "_" instead of numbers.

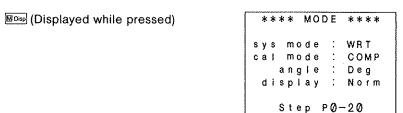

sys mode: WRT cal mode: COMP angle: Deg display: Norm
6392 Bytes Free

Here the previously mentioned program will be stored to program area P0 (indicated by the blinking zero):

Operation Display EXE (Start storage) SHIFT ? ALPHA A : $2 \times \sqrt{3} \times A^2 = \sqrt{2}$ ALPHA A : $2 \times \sqrt{3} \times A^2 = \sqrt{2}$ $2 \div 3 \times ALPHA X = 3$? $\rightarrow A : 2 \times \sqrt{3} \times A^2 = \sqrt{2}$ $\sqrt{2} \div 3 \times A \times \sqrt{3} \times A^2 = \sqrt{2}$

After these operations are complete, the program is stored.

* The system display appears only while the wow key is pressed.

^{*} After the program is stored, press MODE II to return to the RUN mode.

4 Program execution

Operation

Programs are executed in the RUN mode ($\frac{\text{MODE}}{\text{D}}$ 1). The program area to be executed is specified using the $\frac{\text{Prog}}{\text{C}}$ key.

To execute P0: Prog 0 EXE
To execute P3: Prog 3 EXE
To execute P8: Prog 8 EXE

Here the sample program that has been stored will be executed. The surface (S) and volume (V) for the regular octahedron in the sample problem are computed as:

Length of one side (A)	Suface area (S)	Volume (V)
10cm	(346.4101615)cm ²	(471.4045208)cm ³
7	(169.7409791)	(161.6917506)
15	(779.4228634)	(1590.990258)

EXE

^{*} Program computations are performed automatically with each press of EXE when it is pressed after data is input or after the result is read.

* Directly after a program in P0 is executed by pressing Prog 0 EXE as in this example, the Prog 0 command is stored by the replay function. Therefore, subsequent executions of the same program can be performed by simply pressing EXE.

Operation

Prog 0 EXE (P0 program execution)
10 EXE (Input 10 for A)
EXE (Display V when A = 10)
EXE (Reexecute)
7 EXE (Input 7 for A)
EXE (Display V when A = 7)

4-2 PROGRAM CHECKING AND EDITING (CORRECTION, ADDITION, DELETION)

Recalling a stored program can be performed in order to verify its contents. After specifying the desired program area using or in the WRT mode (MODE 2), the program contents will be displayed by pressing the EXE key. Once the program is displayed, the or (or o, o, o, d) key is used to advance the program one step at a time for verification. When the program has been improperly stored, editing can also be performed by adding to it or erasing portions. Here a new program will be created by checking and editing the previous sample program (the surface area and volume of a regular octahedron).

EXAMPLE:

Find the surface area and volume of a regular tetrahedron when the length of one side is given.

Length of one side (A)	Surfa	ce area (S)	Vol	ume (V)
10 cm	()cm²	()cm³
7.5	()	()
20	()	()

(1) Formulas

For a surface area S, volume V and one side A, S and V for a regular tetrahedron are defined as:

$$S = \sqrt{3} A^2$$
 $V = \frac{\sqrt{2}}{12} A^3$

2 Programming

As with the previous example, the length of one side is stored in memory A and the program then constructed.

Numeric value A → ALPHA 🚨 EXE	
3 X ALPHA A x² EXE	·S
✓ 2 ± 12 🛛 ALPHA 🔼 💓 3 EXE ······	٠ ٧

When the above is formed into a program, it appears as follows:

SHIFT ?
$$\rightarrow$$
 ALPHA \triangle : $\sqrt{}$ 3 \times ALPHA \triangle x^2 SHIFT \checkmark 2 \div 12 \times ALPHA \triangle x^y 3

3 Program editing

First, a comparison of the two programs would be helpful.

Octahedron: SHIFT ? — ALPHA \triangle : 2 \boxtimes \checkmark 3 \boxtimes ALPHA \triangle ... 2 SHIFT \nearrow Tetrahedron: SHIFT ? — ALPHA \triangle : \checkmark 3 \boxtimes ALPHA \triangle ... 2 SHIFT \nearrow 4 \bigcirc 2 \bigcirc 12 \boxtimes ALPHA \triangle ... 3

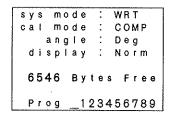

The octahedron program can be changed to a tetrahedron program by deleting the parts marked with wavy lines, and changing those that are marked with straight lines.

In actual practice, this would be performed as follows:

Operation

Display

MODE 2

EXE

Cursor located at beginning. Press SHIFT EXE to bring cursor to end.

?
$$\rightarrow$$
 A: $\sqrt{3}$ X A² $\sqrt{2}$ \div 3 X A x^y 3

Locate cursor at position to be deleted, and delete two characters.

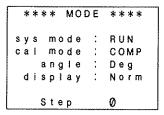

?
$$\rightarrow$$
 A : $\sqrt{3}$ X A 2 $\sqrt{2}$ \div 1 23 X A x y 3

Insert two characters.

DEL

Delete unnecessary 3.

MODE []

Editing cmoplete. Return to the RUN mode.

(4) Program execution

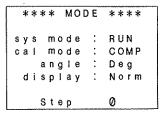

Now this program will be executed.

B		1 position right	, , , ,	End of line (©)
0	1 position left	1 position right (B)	Beginning of line (A)	1 line down (D)
0	1 position left	Invalid	1 line up (©)	Invalid

4-3 PROGRAM DEBUGGING (CORRECTING ERRORS)

After a program has been created and input, it will sometimes generate error messages when it is exeuted, or it will produce unexpected results. This indicates that there is an error somewhere within the program that needs to be corrected. Such programming errors are referred to as "bugs", while correcting them is called "debugging".

Debugging when an error message is generated

An error message is displayed as follows:

The error message informs the operator of the program area (P0 to P9) in which the error was generated. It also states the type of error, which gives an idea of the proper countermeasure, to be taken. The step number indicates in which step of the program area the error was generated.

Error messages

There are a total of seven error messages.

- ① Syn ERROR (Syntax error)
 Indicates a mistake in the formula or a misuse of program commands.
- (2) Ma ERROR (Mathematical error)
 Indicates the computation result of a numeric expression exceeds 10¹⁰⁰, an illogical operation (i.e. division by zero), or the input of an argument that exceeds the input range of the function.
- 3 Go ERROR (Jump error) Indicates a missing Lbl for the Goto command (see page 115), or that the program area (see page 110) for the Prog command (see page 122) does not contain a program.

- 4 Ne ERROR (Nesting error) Indicates a subroutine nesting overflow by the Prog command.
- (5) Stk ERROR (Stack error) Indicates the computation performed exceeds the capacity of the stack for numeric values or for commands (see page 16).
- 6 Mem ERROR (Memory error) Indicates the attempt to use a memory name such as Z [5] without having expanded memories.
- 7 Arg ERROR (Argument error) Indicates the argument of a command or specification in a program exceeds the input range (i.e. Sci 10, Goto 11).

Further operation will become impossible when an error message is displayed. Press AC, 🗢, or 🗗 to cancel the error.

Pressing AC cancels the error and new key input becomes possible. With this operation, the RUN mode is maintained.

Pressing or cancels the error and changes the system mode to the WRT mode. The cursor is positioned at the location where the error was generated to allow modification of the program to eliminate the error.

Checkpoints for each type of error

The following are checkpoints for each type of error:

- ① Syn ERRÔR
 Verify again that there are no errors in the program.
- ② Ma ERROR For computations that require use of the memories, check to see that the numeric values in the memories do not exceed the range of the arguments. This type of error often occurs with division by 0 or the computation of negative square roots.
- ③ Go ERROR
 Check to see that there is a corresponding Lbl n when Goto n is used.
 Also check to see that the program in P n has been correctly input when P rog n is used.
- We ERROR Check to ensure that the Prog command is not used in the branched program area to return execution to the original program area.

(5) Stk ERROR

Check to see that the formula is not too long thus causing a stack overflow. If this is the case, the formula should be divided into two or more parts.

6 Mem ERROR

Check to see that memories were properly expanded using " $\underbrace{\text{MODE}}$: n [EXE]" (Defm). When using array-type memories (see page 126), check to see that the subscripts are correct.

(7) Arg ERROR

Check whether values specified by 6000 [7] (Fix) or 600 [8] (Sci) are within the range of 600 9. Also check whether values specified by Goto, LbI, or Prog commands are within 600 9. Also ensure that memory expansion using 600 [10] (Defm) is performed within the remaining number of steps and that the value used for expansion is not negative.

4-4 COUNTING THE NUMBER OF STEPS

The program capacity of this unit consists of a total of 6566 steps.

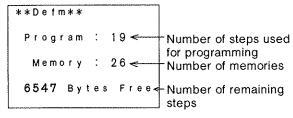

The number of steps indicates the amount of storage space available for programs, and it will decrease as programs are input. The number of remaining steps will also be decreased when steps are converted to memories. (See page 24).

There are two methods to determine the current number of remaining steps:

① When MODE I EXE are pressed in the RUN mode, the number of remaining steps will be displayed together with the number of memories.

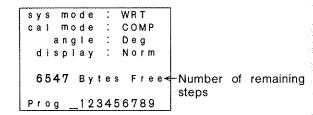

Example:

MODE • EXE

② Specify the WRT mode (MODE ②), and the number of remaining steps will appear. At this time the status of the program areas can also be determined.

Basically, one function requires a single step, but there are some commands where one function requires two steps.

- One function/one step: sin, cos, tan, log, (,), :, A, B, 1, 2, 3, etc.
- One function/two steps: Lbl 1, Goto 2, Prog 8, etc.

Each step can be verified by the movement of the cursor:

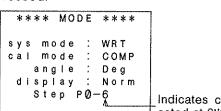

Example:

At this time, each press of a cursor key (or) will cause the cursor to move to the next sequential step. For example:

The display will show at what step of the program the cursor is currently located as long as so is pressed.

Indicates cursor is located at 6th step.

4-5 PROGRAM AREAS AND COMPUTATION MODES

This unit contains a total of 10 program areas (P0 through P9) for the storage of programs. These program areas are all utilized in the same manner, and 10 independent programs can be input. One main program (main routine) and a number of secondary programs (subroutines) can also be stored. The total number of steps available for storage in program areas P0 through P9 is 6566 maximum.

Specification of a program area is performed as follows:

RUN mode: Press any key from 0 through 9 after pressing the Prog key.

Then press EXE.

Example: P 0 Prog 0 EXE P 8 Prog 8 EXE

* In this mode, program execution begins when EXE is pressed.

WRT mode: Use or to move the cursor under the program area to be specified and press EXE.

Only the numbers of the program areas that do not yet contain programs will be displayed. "_" symbols indicate program areas which already contain programs.

Example:

		•		Ш	0	ď	e		:		W	R	Т		
C	•			m					:		C	o	M	P	
			a	ก	g	1	е		:		D	e	g		
	đ	ì	\$	р	l	а	у		:		N	0	r	m	
	6	5	4	7		В	v	ŧ	e	s		F	ŧ	e	e
	-	_	•	•		_	'								
P	r	0	g			1	2	3			6	7		9	

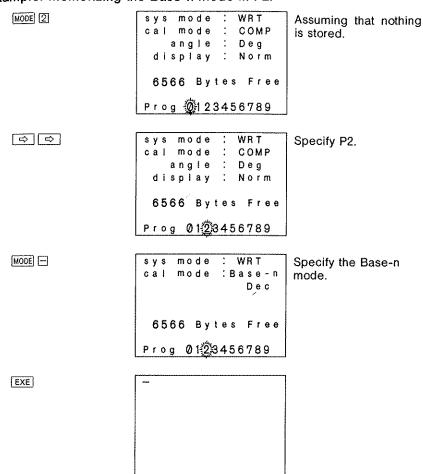

Programs already stored in these program areas.

Program area and computation mode specification in the WRT mode

Besides normal function computations, to perform binary, octal, decimal and hexadecimal computations and conversions, standard deviation computations, and regression computations in a program, a computation mode must be specified. Program mode specification and program area specification are performed at the same time.

First the WRT mode is specified (MODE 2), and then a computation mode is specified. Next, the program area is specified, and, when EXE is pressed, the computation mode is memorized in the program area. Henceforth, stored programs will be accompanied with the computation mode.

Example: Memorizing the Base-n mode in P2.

As shown above, the computation mode will be memorized into a program area.

Cautions concerning the computation modes

All key operations available in each computation mode can be stored as programs, but, depending on the computation mode, certain commands or functions cannot be used.

Base-n mode

- Function computations cannot be performed.
- · Units of angular measurement cannot be specified.
- All program commands can be used.
- Be sure to include a "" at the final result output to return to the previous computation mode when a program execution is terminated. Failure to do so may result in a decimal display or an error.

SD1, SD2 mode

- Among the functions, Abs and √ cannot be used.
- Among the program commands, Dsz, > and < cannot be used.

LR1, LR2 mode

- Among the functions, Abs and ³√ cannot be used.
- Among the program commands, ⇒, =, +, lsz, ≥, ≤, Dsz, > and < cannot be used.

4-6 ERASING PROGRAMS

Erasing of programs is performed in the PCL mode. Press MoDE 3 to specify the PCL mode. There are two methods used to erase programs: erasing a program located in a single program area, and erasing all programs.

Erasing a single program

To erase a program in a single program area, specify the PCL mode and press the AC key after specifying the program area.

Example: Erase the program in P3 only.

Operation	Display	
MODE 3	sys mode: PCL cal mode: COMP angle: Deg display: Norm	P0, P3 and P9 already contain programs.

4-7 CONVENIENT PROGRAM COMMANDS

The programs for this unit are made based upon manual computations. Special program commands, however, are available to allow the selection of the formula, and repetitive execution of the same formula. Here, some of these commands will be used to produce more convenient programs.

Jump commands

Jump commands are used to change the flow of program execution. Programs are executed in the order that they are input (from the lowest step number first) until the end of the program is reached. This system is not very convenient when there are repeat computations to be performed or when it is desirable to transfer execution to another formula. It is in these cases, however, that the jumps commands are very effective. There are three types of jump commands: a simple unconditional jump to a branch destination, conditional jumps that decide the branch destination by whether a certain condition is true or not, and count jumps that increase or decrease a specific memory by one and then decide the branch destination after checking whether the value stored equals zero or not.

Unconditional jump

The unconditional jump is composed of "Goto" and "Lbl". When program execution reaches the statement "Goto n" (where n is a number from 0 through 9), execution then jumps to "Lbl n" (n is the same value as Goto n). The unconditional jump is often used in simple programs to return execution to the beginning for repetitive computations, or to repeat computations from a point within a program.

Unconditional jumps are also used in combination with conditional and count jumps.

Example: The previously presented program to find the surface area and volume of a regular tetrahedron will be rewritten using "Goto 1" and "Lbl 1" to allow repeat computations.

The previous program contained:

?,
$$\rightarrow$$
, A, :, $\sqrt{\ }$, 3, \times , A, x^2 , \checkmark , 2, \div , 1, 2, \times , A, x^y , 3

19 steps

^{*} Hereinafter, commas (,) will be used to separate steps for the sake of clarity.

Add "Goto 1" to the end of the program, and add "Lbl 1" to the beginning of the program as the branch destination.

If this is simply left the way it is, however, the volume will not be displayed and execution will move immediately to the input of one side at the beginning. To prevent this situation, insert a display command (1) in front of the "Goto 1".

The complete program with the unconditional jump added should look like this:

Lbl, 1, :, ?,
$$\rightarrow$$
, A, :, $\sqrt{}$, 3, \times , A, x^2 , \checkmark , 2, \div , 1, 2, \times , A, x^y , 3, \checkmark , Goto, 1

25 steps

Now let's try executing this program.

* For details on inputting programs and editing programs, see sections 4-1 and 4-2.

*Henceforth, the displays will only show computation result output.

Operation		Display	
Prog O EXE	?		Stored in P0.
10 EXE		173.2050808	The length of the side=10
EXE		117.8511302	side—10
EXE	?		
7.5 EXE		97.42785793	The length of the side==7.5
EXE		49.71844555	side7.5
EXE	?		

Since the program is in an endless loop, it will continue execution. To terminate execution, press [1].

MODE 1

	*	*	*	*	••••	М	ō	D	Ε	****
s	у	s		m	0	d	е		:	RUN
C	а	į		m	0	þ	е		:	COMP
			а	n	g	ļ	е		:	Deg
	đ	ì	s	p	ł	а	У		:	Norm
			s	t	ę	p				0

Besides the beginning of the program, branch destinations can be designated at any point within the program.

Example: Compute y=ax+b when the value for x changes each time, while a and b can also change depending upon the computation.

Program

?,
$$\rightarrow$$
, A, \vdots , ?, \rightarrow , B, \vdots , Lbl, 1, \vdots , ?, \rightarrow , X, \vdots , A, \times , X, $+$, B, \checkmark , Goto, 1 23 steps

When this program is executed, the values for a and b are stored in memories A and B respectively. After that, only the value for x can be changed.

In this way an unconditional jump is made in accordance with "Goto" and "Lbl", and the flow of program execution is changed. When there is no "Lbl n" to correspond to a "Goto n", an error (Go ERROR) is generated.

♠ Conditional jumps

The conditional jumps compare a numeric value in memory with a constant or a numeric value in another memory. If the condition is true, the statement following the "">" is executed, and if the condition is not true, execution skips the statement and continues following the next "", ":" or "..."".

Conditional jumps take on the following form:

Left	Relational	Right 📥	State-	{ *" }^	State-
side	operator	side	ment		ment

- * represents carriage return function (see page 124).
- * Anyone can be used.

One memory name (alphabetic character from A through Z), constant numeric values or computation formulas (A \times 2, D-E, etc.) are used for "left side" and "right side".

The relational operator is a comparison symbol. There are 6 types of relational operators: =, \neq , \geq , \leq , <.

Left side = right side (left side equals right side)

Left side + right side (left side does not equal right side)

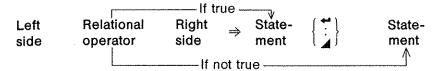

Left side \geq right side (left side is greater than or equal to right side)

Left side ≤ right side (left side is less than or equal to right side)

Left side > right side (left side is greater than right side)

Left side < right side (left side is less than right side)

The "⇒" is displayed when ☐ are pressed. If the condition is true, execution advances to the statement following ⇒. If the condition is not true, the statement following ⇒ is skipped and execution jumps to the statement following the next "♣", ":" or "♣".

A statement is a computation formula (sin A×5, etc.) or a program command (Goto, Prog, etc.), and everything up to the next "♣", ":" or "♣" is regarded as one statement.

Example: If an input numeric value is greater than or equal to zero, compute the square root of that value. If the input value is less than zero, reinput another value.

Program

Lbl, 1,
$$\vdots$$
, ?, \rightarrow , A, \vdots , A, \geq , \emptyset , \Rightarrow , $\sqrt{}$, A, \checkmark , Goto, 1

16 steps

31 steps

In this program, the input numeric value is stored in memory A, and then it is tested to determine whether it is greater than, equal to or less than zero. If the contents of memory A are greater than or equal to 0 (not less than zero), the statement (computation formula) located between "\(\Rightarrow\)" and "\(\Lambda\)" will be executed, and then Goto 1 returns execution to LbI 1. If the contents of memory A are less than zero, execution will skip the following statement to the next "\(\Lambda\)" and returned to LbI 1 by Goto 1.

Example: Compute the sum of input numeric values. If a 0 is input, the total should be displayed.

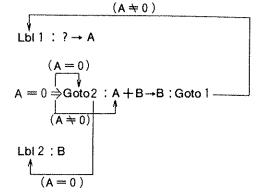

Program

$$0, \rightarrow, B, :,$$
Lbl, 1, :, ?, \rightarrow , A, :, A, =, $0, \Rightarrow$, Goto, 2, :,
A, $+$, B, \rightarrow , B, :, Goto, 1, :,
Lbl, 2, :, B

In this program, a 0 is first stored in memory B to clear it for computation of the sum. Next, the value input by "? \rightarrow A" is stored in memory A by "A=0 \Rightarrow " and it is determined whether or not the value stored in memory A equals zero. If A=0, Goto 2 causes execution to jump to LbI 2. If memory A does not equal 0, Goto 2 will be skipped and the command A+B \rightarrow B which follows ":" is executed, and then Goto 1 returns execution to LbI 1.

Execution from LbI 2 will display the sum that has been stored in memory B. Actually, the display command "" is inserted following B, but here it can be omitted.

The following illustration shows the flow of the program:

Count jumps

The count jumps cause the value in a specified memory to be increased or decreased by 1. If the value does equal 0, the following statement is skipped, and the statement following the next "\(\delta\)", ":" or "\(\delta\)" is executed. The "lsz" command is used to increase the value in memory by 1 and decide the subsequent execution, while the "Dsz" command is used to decrease the value by 1 and decide.

Example: Increase memory A by one ······ Isz A

Decrease memory B by one ····· Dsz B

Example: Determine the average of 10 input numeric values. Program

1,
$$\emptyset$$
, \rightarrow , A, :, \emptyset , \rightarrow , C, :,
Lbl, 1, :, ?, \rightarrow , B, :, B, +, C, \rightarrow , C, :,
Dsz, A, :, Goto, 1, :, C, \div , 1, \emptyset

32 steps

In this program, first 10 is stored in memory A, and 0 is stored in memory C. Memory A is used as the "counter" and countdown is performed the specified number of times by the Dsz command. Memory C is used to store the sum of the inputs, and so first must be cleared by inputting a 0. The numeric value input in response to "?" is stored in memory B, and then the sum of the input values is stored in memory C by "B+C→C". The statement Dsz A then decreases the value stored in memory A by 1. If the result does not equal 0, the following statement, Goto 1 is executed. If the result equals 0, the following Goto 1 is skipped and "C÷10" is executed.

Example: Determine the altitude at one-second intervals of a ball thrown into the air at an initial velocity of Vm/sec and an angle of S°. The formula is expressed as: $h=V\sin\theta\ t-\frac{1}{2}gt^2$, with g=9.8, with the effects of air resistance being disregarded.

Program

Deg, :,
$$\emptyset$$
, \rightarrow , T, :, ?, \rightarrow , V, :, ?, \rightarrow , S, :,
Lbl, 1, :, lsz, T, :, V, \times , sin, S, \times , T, $-$,
9, \cdot , 8, \times , T, x^2 , \div , 2, \triangle , Goto, 1

38 steps

In this program the unit of angular measurement is set and memory T is first initialized (cleared). Then the initial velocity and angle are input into memories V and S respectively.

Lbl 1 is used at the beginning of the repeat computations. The numeric value stored in memory T is counted up (increased by 1) by Isz T. In this case, the Isz command is used only for the purpose of increasing the value stored in memory T, and the subsequent jump does not depend upon any comparison or decision. The Isz command can also be used in the same manner as seen with the Dsz command for jumps that require decisions, but, as can be seen here, it can also be used to simply increase values. If, in place of the Isz command, another method such as "T+1 \rightarrow T" is used, five steps are required instead of the two for the (Isz T) method shown here. Such commands are convenient ways of conserving memory space.

Each time memory T is increased, computation is performed according to the formula, and the altitude is displayed. It should be noted that this program is endless, so when the required value is obtained, MODE II are pressed to terminate the program.

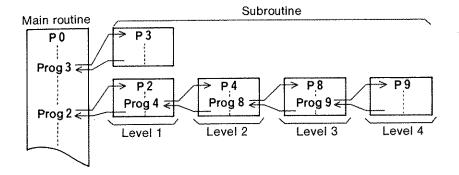

(Summary)

Command	Formula	Operation
Unconditional	Lbl n	Performs unconditional jump to
jump	Goto n (n=natural number	Lbl n corresponding to Goto n .
	from 0 through 9)

Subroutines

A program contained in a single program area is called a "main routine". Often used program segments stored in other program areas are called "subroutines".

Subroutines can be used in a variety of ways to help make computations easier. They can be used to store formulas for repeat computations as one block to be jumped to each time, or to store often used formulas or operations for call up as required.

The subroutine command is "Prog" followed by a number from 0 through 9 which indicates the program area.

Example: Prog 0 ······Jump to program area 0 Prog 2 ······Jump to program area 2

After the jump is performed using the Prog command, execution continues from the beginning of the program stored in the specified program area. After execution reaches the end of the subroutine, the program returns to the statement following the Prog n command in the original program area. Jumps can be performed from one subroutine to another, and this procedure is known as "nesting". Nesting can be performed to a maximum of 10 levels, and attempts to exceed this limit will cause an error (Ne ERROR) to be generated. Attempting to use Prog to jump to a program area in which there is no program stored will also result in an error (Go ERROR).

* A Goto n contained in a subroutine will jump to the corresponding Lbl n contained in that program area.

Example: Simultaneously execute the two previously presented programs to compute the surface areas and volumes of a regular octahedron and tetrahedron.

Express the result in three decimal places.

This example employs two previously explained programs, and the first step is to input the specified number of decimal places (MODE 7 3).

Now let's review the two original programs.

Regular octahedron

P0 Fix, 3, :, ?,
$$\rightarrow$$
, A, :, 2, \times , $\sqrt{}$, 3, \times , A, x^2 , $\sqrt{}$, 2, \div , 3, \times , A, x^y , 3 23 steps

Regular tetrahedron

P1 Fix, 3, :, ?,
$$\rightarrow$$
, A, :, $\sqrt{}$, 3, \times , A, x^2 , $\sqrt{}$, 2, \div , 1, 2, \times , A, x^3 , 3

22 steps

Total: 45 steps

If the two programs are compared, it is evident that the underlined portions are identical. If these portions are incorporated into a common subroutine, the programs are simplified and the number of steps required is decreased.

Furthermore, the portions indicated by the wavy line are not identical as they stand, but if P1 is modified to: $\sqrt{}$, 2, \div , 3, \times , A, x^* , 3, \div , 4, the two portions become identical.

Now the portions underlined by the straight line will be stored as an independent routine in P9 and those underlined with the wavy line will be stored in P8.

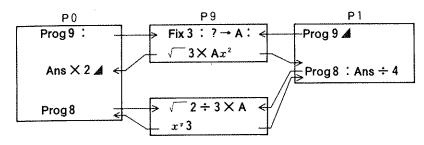

P9 Fix, 3, :, ?,
$$\rightarrow$$
, A, :, $\sqrt{\ }$, 3, \times , A, x^2
P8 $\sqrt{\ }$, 2, \div , 3, \times , A, x^y , 3
12 steps 8 steps

After the common segments have been removed, the remainder of the regular octahedron formula is stored in P0, and that of the regular tetrahedron is stored in P1. Of course, the "Prog 9" and "Prog 8" must be added to jump to subroutines P9 and P8.

With this configuration, execution jumps to program P9 at the beginning of programs P0 and P1, three decimal places are specified, the value for one side is entered, and the surface area of the tetrahedron is computed. The expression "2 \times " of the original octahedron formula was omitted in P9, so when execution returns to P0, "Ans \times 2" is used to obtain the surface of the octahedron. In the case of P1, the result of P9 needs no further modification and so is immediately displayed upon return to P1.

Computation of the volumes is also performed in a similar manner. After a jump is made to P8 for computation, execution returns to the main routines. In P0, the program ends after the volume of the octahedron is displayed. In P1, however, the result computed in P8 is divided by four to obtain the volume of the tetrahedron. By using subroutines in this manner, steps can be shortened and programs become neat and easy to read.

The following illustration shows the flow of the program just presented.

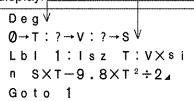

By isolating the common portions of the two original programs and storing them in separate program areas, steps are shortened and programs take on a clear configuration.

Carriage return function

With the carriage return function, EXE is used in place of □ to separate commands to produce easy-to-read displays.

Deg:
$$0 \rightarrow T$$
: ? $\rightarrow V$: ? $\rightarrow S$:
Lb! 1: Isz T: $V \times S$ i
n $S \times T - 9 \cdot 8 \times T^2 \div 2 \checkmark$
Goto 1

these two loca-

tions. Nothing is

displayed at the

point where EXE is

pressed, and the

display advances

to the next line.

This makes angle unit setting and looped operations, etc. easier to follow.

Operation procedure

MODE 4 EXE (Press in place of [])

O ALPHA I SHIFT ? ALPHA I EXE

SHIFT Lbi []

* To include the carriage return function in a program that has already been input, first press with INS to specify the insert mode and then press EXE. Then, delete the ":".

Deg:
$$0 \rightarrow T$$
: $? \rightarrow V$: $? \rightarrow S$:
Lb! 1: Isz T: VXsi
n SXT-9.8XT²÷2 \checkmark
Goto 1

Align the cursor with the ":" following "Deg" and press SHIFT INS EXE.

Deg

$$[:]0 \rightarrow T : ? \rightarrow V : ? \rightarrow S : L b I$$

1: Isz T: V×sin S
×T-9.8×T²÷2₄
Goto 1

Delete the ":".

Deg

$$[Q] \rightarrow T:? \rightarrow V:? \rightarrow S:Lb!$$

1: | sz T: V × sin S ×
T-9.8 × T² ÷ 2₄
Goto 1

Align the cursor with the " \vdots " following "? \rightarrow S". As above, first insert EXE and then delete the " \vdots ".

Deg

$$\emptyset \rightarrow T : ? \rightarrow V : ? \rightarrow S$$

 $L b \mid 1 : l s z \quad T : V \times s \mid$
 $n \quad S \times T - 9 \cdot 8 \times T^2 \div 2 \square$
Goto 1

* Carriage return can be used in manual operations by pressing SHIFT EXE.

4-8 ARRAY-TYPE MEMORIES

Using array-type memories

Up to this point all of the memories used have been referred to by single alphabetic characters such as A, B, X, or Y.

With the array-type memory introduced here, a memory name (one alphabetic character from A through Z) is appended with a subscript such as [1] or [2].

* Brackets are input by ALPHA : and ALPHA EXP.

Standard	Array-type					
memory	memory					
. A	A[0]	C[-2]				
В	A[1]	C[-1]				
С	A[2]	C[0]				
D	A[3]	C[1]				
E	A[4]	C[2]				

Proper utilization of subscripts shortens programs and makes them easier to use. Negative values used as subscripts are counted in relation to memory zero as shown above.

Example: Input the numbers 1 through 10 into memories A through J.

Using standard memories

1,
$$\rightarrow$$
, A, :, 2, \rightarrow , B, :, 3, \rightarrow , C, :, 4, \rightarrow , D, :, 5, \rightarrow , E, :, 6, \rightarrow , F, :, 7, \rightarrow , G, :, 8, \rightarrow , H, :, 9, \rightarrow , I, :, 1, 0, \rightarrow , J 40 steps

Using array-type memories

$$0, \rightarrow, Z, \vdots, Lbl, 1, \vdots, Z, +, 1, \rightarrow, A, [, Z,], \vdots,$$

Isz, Z, $\vdots, Z, <, 1, 0, \Rightarrow, Goto, 1$ 26 steps

In the case of using standard memories, inputting values into memories one by one is both inefficient and time consuming. What happens, if we want to see a value stored in a specific memory?

Using standard memories

Lbl, 1, :, ?,
$$\rightarrow$$
, Z, :,
Z, =, 1, \Rightarrow , A, A, Z, =, 2, \Rightarrow , B, A,
Z, =, 3, \Rightarrow , C, A, Z, =, 4, \Rightarrow , D, A,
Z, =, 5, \Rightarrow , E, A, Z, =, 6, \Rightarrow , F, A,
Z, =, 7, \Rightarrow , G, A, Z, =, 8, \Rightarrow , H, A,
Z, =, 9, \Rightarrow , I, A, Z, =, 1, 0, \Rightarrow , J, A,
Goto, 1

70 steps

Using array-type memories

16 steps

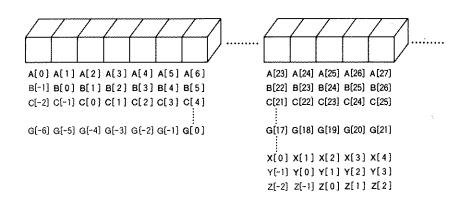

The difference is readily apparent. When using the standard memories, the input value is compared one by one with the value assigned to each memory (i.e. A=1, B=2, . .).

With the array-type memories, the input value is immediately stored in the proper memory determined by "[Z-1]". Formulas (Z-1, A+10, etc.) can even be used for the subscript.

Cautions when using array-type memories

When using array-type memories, a subscript is appended to an alphabetic character that represents a standard memory from A through Z.

Therefore, care must be taken to prevent overlap of memories. The relation is as follows:

The following shows a case in which array-type memories overlap with standard format memories. This situation should always be avoided.

Example: Store the numeric values from 1 through 5 in memories A[1] through A[5] respectively.

44 steps

In this program, the values 1 through 5 are stored in the array-type memories A[1] through A[5], and memory C is used as a counter memory. When this program is executed, the following results are obtained:

Operation	Display
Prog 0 EXE	1.
EXE	0.
EXE	3.
EXE	4.
EXE	5.

As can be seen, the second displayed value (which should be 2) in A[2] is incorrect. This problem has occurred because memory A[2] is the same as memory C.

The content of memory C (A[2]) is decreased from 5 to 0 in steps of 1. Therefore, the content of memory A[2] is displayed as 0.

Application of the array-type memories

It is sometimes required to treat two different types of data as a single group. In this case, memories for data processing and those for data storage should be kept separate.

Example: Store data x and y in memories. When an x value is input, the corresponding y value is displayed. There will be a total of 15 pieces of data.

Example program 1

Memory A is used as the data control memory, and memory B is used for temporary storage of the x data. The x data are stored in memories C[1] (memory D) through C[15] (memory R), and the y data are stored in memories C[16] (memory S) through C[30] (memory Z[7]).

1,
$$\rightarrow$$
, A, :, Defm, 7, :,
Lbl, 1, :, ?, \rightarrow , C, [, A,], :,
?, \rightarrow , C, [, A, +, 1, 5,], :,
Isz, A, :, A, =, 1, 6, \Rightarrow , Goto, 2, :, Goto, 1, :,
Lbl, 2, :, 1, 5, \rightarrow , A, :, ?, \rightarrow , B, :,
B, =, \emptyset , \Rightarrow , Goto, 5, :,
Lbl, 3, :, B, =, C, [, A,], \Rightarrow , Goto, 4, :,
Dsz, A, :, Goto, 3, :, Goto, 2, :,
Lbl, 4, :, C, [, A, +, 1, 5,], \blacktriangleleft , Goto, 2, :,
Lbl, 5

98 steps

In this program, memories are used as follows:

x data

C[1] C[2] C[3] C[4] C[5] C[6] C[7] C[8]

Example program 2

The same memories are used as in Example 1, but two types of memory names are used and the x and y data kept separate.

```
1, \rightarrow, A, :, Defm, 7, :,

Lbl, 1, :, ?, \rightarrow, C, [, A, ], :,

?, \rightarrow, R, [, A, ], :,

Isz, A, :, A, =, 1, 6, \Rightarrow, Goto, 2, :, Goto, 1, :,

Lbl, 2, :, 1, 5, \rightarrow, A, :, ?, \rightarrow, B, :,

B, =, 0, \Rightarrow, Goto, 5, :,

Lbl, 3, :, B, =, C, [, A, ], \Rightarrow, Goto, 4, :,

Dsz, A, :, Goto, 3, :, Goto, 2, :,

Lbl, 4, :, R, [, A, ], \blacktriangleleft, Goto, 2, :,

Lbl, 5
```

Memories are used as follows:

$$x$$
 data $C[1]$ $C[2]$ $C[3]$ $C[4]$ $C[5]$ $C[6]$ $C[7]$ $C[8]$ D E F G H I J K $C[9]$ $C[10]$ $C[11]$ $C[12]$ $C[13]$ $C[14]$ $C[15]$ L M N O P Q R Y data $R[1]$ $R[2]$ $R[3]$ $R[4]$ $R[5]$ $R[6]$ $R[7]$ $R[8]$ S T U V W X Y Z $R[9]$ $R[10]$ $R[11]$ $R[12]$ $R[13]$ $R[14]$ $R[15]$ $Z(1)$ $Z(2)$ $Z(3)$ $Z(4)$ $Z(5)$ $Z(6)$ $Z(7)$

In this way, the memory names can be changed. However, since memory names are restricted to the letters from A through Z, the expanded memories (MODE :) can only be used as array-type memories.

* The memory expansion command (Defm) can be used in a program.

Example: Expand the number of memories by 14 to make a total of 40 available.

4-9 DISPLAYING ALPHA-NUMERIC CHARACTERS AND SYMBOLS

Alphabetic characters, numbers, computation command symbols, etc. can be displayed as messages. They are enclosed in quotation marks (MPM Prog).

Alpha-numeric characters and symbols

- ◆ Characters and symbols displayed when pressed following ALPHA:

 k, m, µ, n, p, f, space,
 B, C, D, E, F, G, H, I, J, K, L, M, N,
 P, Q, R, S, T, U, V, W, X, Y, Z
- ◆ Other numbers, symbols, calculation commands, program commands \emptyset , 1, 2, 3, 4, 5, 6, 7, 8, 9, (,), $\sqrt{}$, ε , +, -, \times , \div , ... sin, cos, tan, log, ln, ... =, \pm , \geq , \leq , >, <, ... A, B, C, D, E, F, d, h, b, o Neg, Not, and, or, xor \bar{x} , \bar{y} , $x\sigma_n$, $x\sigma_{n-1}$, ... ° (SHIFT MODE \triangle), '(SHIFT MODE \triangle), '(SHIFT MODE \triangle)
- * All of the above noted characters can be used in the same manner as the alphabetic characters.

In the preceding example requiring an input of two types of data (x, y), the prompt "?" does not give any information concerning the type of input expected. A message can be inserted before the "?" to verify the type of data required for input.

Lbl, 1, :, ?,
$$\rightarrow$$
, X, :, ?, \rightarrow , Y, :, ...

The messages "X=" and "Y=" will be inserted into this program.

Lbl, 1, :, ",
$$X$$
, =, ", ?, \rightarrow , X , :, ", Y , =, ", ?, \rightarrow , Y , :, ...

If messages are included as shown here, the display is as follows: (Assuming that the program is stored in P1)

Messages are also convenient when displaying result in program computations.

Example:

Lbl, 0, :, ", N, =, ", ?, →, B,
$$\sim$$
, C, :, 0, →, A, :,
Lbl, 1, :, C, ÷, 2, →, C, :, Frac, C, \neq , 0, \Rightarrow , Goto, 3,
:, Isz, A, :, C, =, 1, \Rightarrow , Goto, 2, :, Goto, 1, :,
Lbl, 2, :, ", X, =, ", \checkmark , A, \checkmark , Goto, 0, :,
Lbl, 3, :, ", N, O, ", \checkmark , Goto, 0 70 steps

This program computes the x power of 2. A prompt of "N=?" appears for data input. The result is displayed by pressing EXE while "X=" is displayed. When an input data is not the x power of 2, the display "NO" appears and execution returns to the beginning for reinput.

Assuming that the program is stored in P2:

Prog 2 EXE	
4096 EXE	
EXE	
EXE	
3124 EXE	
EXE	
512 EXE	
EXE	

N = ?	
X =	
	12.
N=?	
NO	
N=?	
X =	
	9.

Strings longer than 16 characters are displayed in two lines. When alphabetic characters are displayed at the end of the bottom line, the entire display shifts upwards and the uppermost line disappears from the display.

4-10 USING THE GRAPH FUNCTION IN PROGRAMS

Using the graph function within programs makes it possible to graphically represent long, complex equations and to overwrite graphs repeatedly. All graph commands (except the trace function) can be included in programs. Range values can also be written into the program.

Generally, manual graph operations can be used in programs without modification.

Ex. 1) Graphically determine the number of solutions (real roots) that satisfy both of the following two equations.

$$y = x^4 - x^3 - 24x^2 + 4x + 80$$

 $y = 10x - 30$

The range values are as follows:

First, program the range settings. Note that values are separated from each other by commas ", ".

Range, (—), 1,
$$\emptyset$$
, \bullet , 1, \emptyset , \bullet , 2, \bullet , (—), 1, 2, \emptyset , \bullet , 1, 5, \emptyset , \bullet , 5, \emptyset

Next, program the equation for the first graph.

Graph, X,
$$x''$$
, 4, -, X, x'' , 3, -, 2, 4, X, x^2 , +, 4, X, +, 8, \emptyset

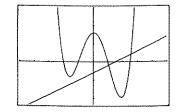

Finally, program the equation for the second graph.

Total 49 steps

When inputting this program, press EXE after input of the ranges and the first equation.

The following should appear on the display when the program is executed:

Prog () EXE

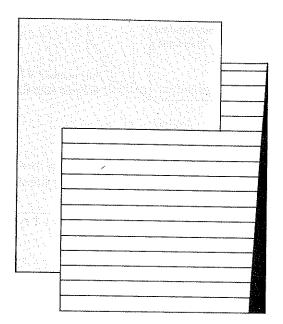

A "A" can be input in place of the EXE key operation after the first equation to suspend execution after the first graph is produced. To continue execution to the next graph, press EXE,

The procedure outlined above can be used to produce a wide variety of graphs.

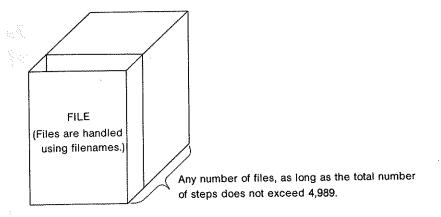

The library at the end of this manual includes a number of examples of graph programming.

5. FILE EDITOR

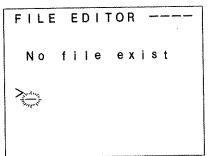

5-1 WHAT IS A FILE EDITOR?

Various types of files can be stored and recalled using the built-in File Editor function which has a total capacity of 4,989 steps.

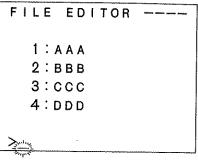

1) File input

The file editor mode is entered by pressing [III], or by pressing ED" [EXE] or EDITOR" [EXE]. The following message is displayed when no file is present:

Only the first four files already present in memory are displayed in the sequence in which they were input.

The display illustrated above indicates that files AAA, BBB, CCC, and DDD are present in memory.

• File input when no file exists in memory

This procedure will be explained assuming that the following data are to be entered:

Filename: TRIANGLE AREA=BASE*ALTITUDE÷2

Confirm that the cursor (>__) is shown on the display, and enter the file-name "TRIANGLE".

Operation

" DRUANGUE "

Display FILE EDITOR ----

No file exist

>"TRIANGLE"_

Note that filenames should be enclosed in quotation marks. However, the quotation marks at the end of the filename may be omitted.

Filenames are limited to eight characters in length, and anything following the eighth character is disregarded. The first position of the filename must be an upper-case alphabetic character. Note that this procedure is different from that used for program computations in chapter 4. In the file editor mode, alphabetic characters can be entered directly. Pressing the key displays the character or function printed on the keytop. See page 162 for details.

Pre

key after entering the filename.

NEW FILE

key in Password

if needless

press "EXE"

"AC" for QUIT

The display illustrated above prompts entry of a password if required. If, in place of this display, the display clears and the cursor is blinking in the upper left, see the section titled: PASSWORDS.

The password function keep private data secure by making it impossible for anyone who doesn't know the password to access the data stored in the unit. A password is not essential for data storage, but here, the password ABC will be registered for the sake of example.

Operation

Display

ABC

NEW FILE

Key in Password

if needless

press "EXE"
"AC" for QUIT

EXE

/e}\

Pressing EXE causes the display to clear and the cursor to move to the upper right corner of the display. This is the file data input mode.

PASSWORDS -

- Pressing MODE EXP while in the filename input mode (see page 139) causes either Password or non-password to appear on the display for approximately two seconds. Each press of MODE EXP causes the display to switch between these two messages. The message Password should be displayed when a password is to be assigned to the file, while non-password should be displayed when a password is not necessary. The example in this section is being performed under the Password status. To specify the non-password status, the unit enters the file data input mode directly after the filename is entered.
- Even when Password is specified, a file can be created without a password by pressing EXE while the password input display is shown. This will directly enter the file data input mode. Pressing A© while the password input display is shown cancels the filename and password, and returns to the filename input mode.
- Passwords are limited to 126 characters in length.
- Though different passwords can be assigned to different files, only one password can be assigned to a single file.

• Data input to a file

Operation

ARBAALPHA SHIFT = ALPHA BASE

ALPHA SHIFT X ALPHA A B II II II O D E

ALPHA 🛨 [2]

(See page 162 for input keys)

Display

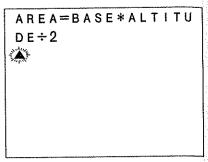

AREA=BASE*ALTITU
DE÷2

Pressing EXE moves the cursor one line down from its current position to indicate entry of the first data item.

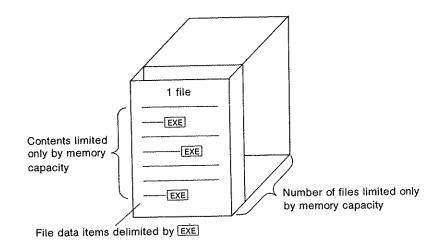

Operation

Display

EXE

As many data items as desired can be stored in a single file, limited only by memory capacity. The number of files created is also limited only by memory capacity.

Once file input is complete, press AC (\$ displayed) followed by E EXE to return to the filename input mode. Entering END EXE returns to the RUN mode (see page 155).

Operation

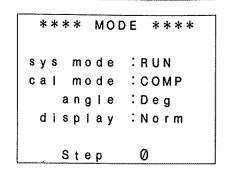

AC E EXE

Display
FILE EDITOR ---

1:TRIANGLE -*-

> Jane

(EXE) (I (D EXE)

The "-*-" symbol following "1: TRIANGLE" indicates that a password has been assigned to this file.

2 File recall

To recall the file entered in the preceding example, first press MODE (1) to enter the file editor mode (filename input mode).

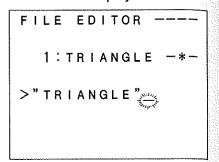

FILE EDITOR ---
1:TRIANGLE -*-

Now enter the filename assigned to the desired file.

Operation

Display

" TRUANGLE "

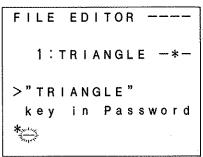

A prompt appears requesting the password when EXE is pressed. The file is treated as a new file if the filename entered differs from that actually assigned to the file, and NEW FILE appears on the display. Should this happen, press AC and try entering the proper filename again. File contents are displayed immediately after filename input when the file has not been assigned a password.

Operation

Display

EXE

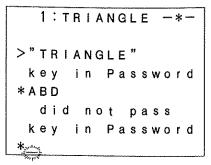

Enter the password (ABC).

A B C EXE

AREA=BASE*ALTITU DE÷2 The first eight lines of the file contents are displayed with the cursor located at the upper left if the password matches that assigned to the file. A mismatched password result in the display illustrated below:

ABD

In this case, try reentering the correct password once again.

Once the file contents are displayed, each press of EXE moves the cursor to the beginning of the next data item below the current location.

3 File editing

Data can be edited as required by first recalling the file in which the data are stored (see: File Recall).

Deletion

Move the cursor to the character to be deleted and press DEL.

Insertion

Move the cursor to the location of the insertion, press ALPHA SHIFT (ALPHA to enter the insert mode, and then input the desired characters.

Correction

Move the cursor to the character to be corrected and press the proper key.

5-2 COMMAND FUNCTION

The command function is provided to make the file editor function easier to use. The commands used are different depending which file editor mode (file name input or file data input) is being used.

1 Filename input mode commands

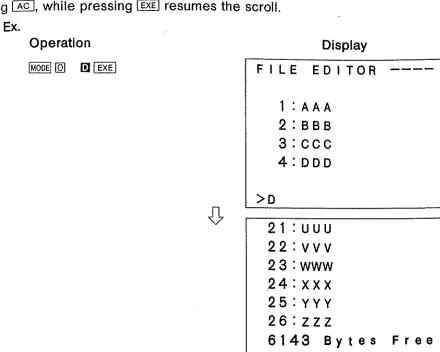

Press HODE ① to enter the filename input mode. Pressing 1900 at this time produces the following display:

D: Dump all File
F: Free Bytes
DEL: Delete File
DELA: Delete All
except -*-File
E: Editor End
": file name top

This is called a "command menu", and it is displayed until with is released. The six commands shown in this command menu can be used while in the filename input mode. (Actually, seven commands are provided in this mode.)

D command (Dump All File)

Displays filenames of all files created using the file editor function. Only the first four filenames stored are displayed when the filename input mode is entered. Pressing D EXE causes the filenames below those displayed to scroll on the display. The speed of the scroll can be increased by holding down EXE. The scrolling can be halted at any point by pressing AC, while pressing EXE resumes the scroll.

The number of file editor steps remaining is displayed after the final filename listed.

F command (Free Bytes)

Displays the number of remaining steps available for file input.

Ex.

Operation

EXE

Display

1:AAA
2:BBB
3:CCC
4:DDD

>F
6143 Bytes Free
>

■ DEL command (Delete File)

Deletes the file specified by "filename", and is used to erase from memory any files no longer required.

Ex. Deletion of file under filename "YYY".

Operation

Display

D B C " Y Y Y " EXE

1: A A A
2: B B B
3: C C C
4: D D D

The message "Deleted!!" is displayed when the specified filename is deleted, while "File not found" appears when the specified filename does not exist. The proper password must be entered following the filename to delete files to which passwords have been assigned. Such a file is not deleted if an improper or incorrect password is entered.

■ DELA command (Delete All Except -*-File)

DELA EXE deletes all files except those to which passwords have been assigned, while DELA * EXE deletes all files, including those with passwords.

Ex. Password assigned to filename "FFF" only.

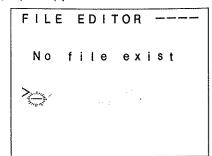

Operation

Display

D'E LA EXE

As mentioned above, using DELA* [EXE] in the above example would delete all files and cause the following display to appear:

E command (Editor End)

Returns from the file editor mode to the RUN mode for standard calculations and graph display.

Operation

EXE

Display

**** MODE ****

sys mode : RUN
cal mode : COMP
angle : Deg
display : Norm

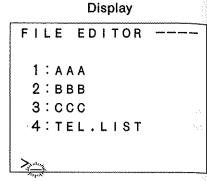

" (File name top)

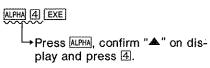

Though not actually a command, quotation marks are used in commands to enclose filenames. As noted previously, the quotation marks at the end of a filename may be omitted.

m (Positive integer)

This command is not listed on the command menu, but it is convenient to use when recalling files. Files can be recalled by simply entering their menu number instead of the full name.

Operation

ANDERSON	
03-583-4111	
СООК	
0552-73-3111	
JACKSON	
045-211-0821	
JOHNSON	
06-632-2151	

The proper password must be entered following the menu number to access files to which passwords have been assigned.

② File data input mode commands

Press MODE ① to enter the filename input mode, and input a filename (and password if required). The file data input mode will be entered if the specified filename (and password) exists. Pressing MODE at this time produces the following display:

	ΗЕ	LP		88
AC:	Со	m m	and M	o d e
v: v	i d	e o	Mode	
т: т	οр	В	: Bot	t o m
n: M	0 V	е	n-L in	e s
s: s	e a	r c	h Str	ing
L: L	o n	g	Searc	h
E: F	i I	е	Out	

The number in the upper righthand corner of this display (command menu) indicates the number of steps from the beginning of the file to the current cursor position. This menu is displayed until his released. The seven commands shown in this command menu can be used while in the filename input mode.

AC (Command Mode)

Pressing AC while in the file data input mode causes "\$__" to appear at the bottom of the display (indicating command mode). Any of the following commands can be entered while "\$__" is displayed.

V command (Video Mode)

Returns from the command mode to the file data input mode.

Operation

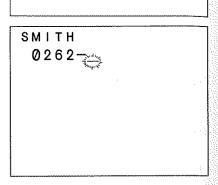

Display

SMITH 0262-

AC pressed by mistake

T command (Top)

Moves the cursor from its present location to the beginning of the file. The first eight lines of the file are displayed after this command is executed.

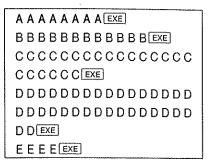

■ B command (Bottom)

Moves the cursor from its present location to the end of the file.

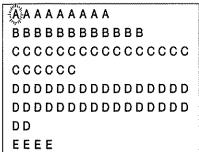

n (Integer) command (Move n-lines)

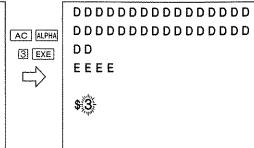

Moves the cursor from its present location by the number (integer/negative) of lines specified by n. The word "lines" as it is used here does not refer to the physical lines on the display, but as a logical line. One logical line is defined as being from the leftmost column on the display (at the beginning of the file or following $\boxed{\text{EXE}}$) to the next occurrence of $\boxed{\text{EXE}}$. This means that even though data may occupy three physical lines on the display, it is counted as one line if there is only one $\boxed{\text{EXE}}$ at the end.

Ex.

In the display illustrated above, <code>EXE</code> symbols are added for the purpose of explanation only, and do not actually appear on the display. Entering <code>AC</code>3 <code>EXE</code> while the cursor is located at the beginning of the above display moves the cursor to the beginning of the line of D's (4th logical line/5th physical line).

Once a value is entered for n, the cursor will move n number of logical lines each time <code>EXE</code> is pressed. Assigning a negative value for n (indicated by <code>[-]</code>, not <code>[-]</code>) causes the cursor to move up by the specified number of lines. Assigning a value which exceeds the number of lines above or below the current cursor position moves to the top or bottom of the file, respectively.

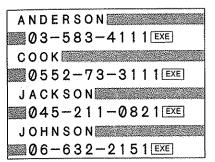

S command (Search String)

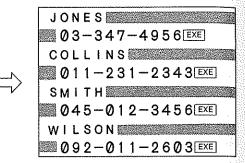

Locates and displays the first occurrence of a data item which includes the characters specified by the search element, with the cursor located under the first character. See the L command for locating multiple occurrences. The message "cannot find" is displayed if the specified search element does not exist.

L command (Long Search)

Locates and displays all occurrences of data items which include the characters specified by the search element. The search can be halted at any point by pressing AC, and resumed by pressing EXE. The speed of the search can be increased by holding down EXE.

Ex. In the following telephone list, indicating spaces and EXE are included for explanation only.

• Locate the first occurrence of a telephone number beginning with "045".

Operation

Display

● Locate all data which include "03".

Operation

AC ALPHA O 3 EXE

Display

\$L03 ANDERSON 03-583-4111 JONES 03-347-4956 WILSON 092-011-2603

Note in the examples given above that the search element is located no matter where it appears in a data item.

■ E command (File Out)

Cancels the file data input mode and returns to the filename input mode.

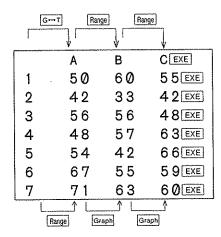

■ END command

Cancels the file editor mode and returns to the RUN mode (MODE 11).

5-3 TAB FUNCTION

A tab function can be used to easily line up columns of data in the file editor function. Tabs are entered using Graph (2 spaces), Range (3 spaces), and G-T (4 spaces).

Ex.

- * can be used to return the cursor to the column at which a tab key was originally pressed.
- * The tab function cannot be used after ALPHA is pressed.

5-4 COUNTING THE NUMBER OF STEPS

The capacity of the file editor function is 4,989 steps. A step indicates a unit of capacity for the storage of files, and the number of steps remaining decreases each time a file is stored in memory. The current number of remaining steps can be displayed using the F command in the filename input mode (see page 148).

Basically, commands are referred to as "1-step functions" and "2-step functions".

- ●1-step functions: A, B, 1, 2, 3, Sin, log, Graph Y=, EXE, etc.
- 2-step functions: Lbl 1, Goto 2, Prog 8, etc.

Cursor movement on the display is in units of one step. The number of steps from the beginning of a file to the current cursor position (excluding steps used for filename, password, and file management) can be confirmed by holding down while in the file data input mode. The number of steps used for the filename and password is equal to the total number of characters in the filename and password plus one. File management requires one step for each file present in memory minus one (i.e. a single file does not take up a step).

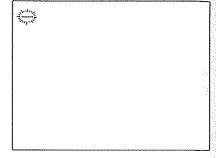

5-5 INCLUDING PROGRAMS IN FILES

Besides data, the file editor can be used much like the program area for the storage of programs. This feature can be used to store portions of a program using the file editor as subroutines when the number of steps in the program area is insufficient.

1 Program storage

The programming procedure used with the file editor (MODE ①) is identical to that in the program area (MODE ②). The only difference is that a filename is required when using the file editor mode. For the sake of explanation, the same program used as the program area sample (surface area and volume of regular octahedron, page 92) will be entered under the filename "OCT".

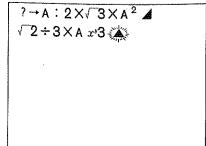

SHIFT ? \rightarrow ALPHA \triangle : 2 \times \bigcirc 3 \times ALPHA \triangle \bigcirc SHIFT \bigcirc 2 \ominus 3 \times ALPHA \triangle \bigcirc 3

The sequence noted above was used to enter the program in the program area. Note the changes required in the following sequence for the file editor mode.

Once the entire program is input, enter AC END EXE to return to the RUN mode. Now to execute the program, enter Prog "OCT" EXE while in the RUN mode.

Prog SHIFT ALPHA " O C T EXE

```
?→A: 2×√3×A² 4
√2÷3×A x³3
$END
Prog "OCT
?
```

Try entering a value of 10 in response to the prompt.

10 EXE

```
?→A:2×√3×A² 4
√2÷3×A x³3
$END
Prog "OCT
?
10
346.4101615
— Disp —
```

The surface area is computed and displayed. Press EXE to produce the volume.

EXE

② Subroutines

Programs stored in a file can also be used as subroutines (see page 121). Such subroutines can be nested up to 11 levels, and exceeding this generates an error (Ne ERROR). A "Go ERROR" is generated when a file is not present in the program area specified by Prog n, while a "File not found" error occurs when the filename specified by Prog "filename" does not exist.

Ex. Write a program which selects either sin curve or cos curve using numeric keys and draw the graph.

In this example, the selection routine will be stored in the program area, while the graphs will be in files.

Set the range to the values shown here.

Now enter the following program in P0.

Lbl, 1, :, ?,
$$\rightarrow$$
, A, : A, =, 1, \Rightarrow , Prog, ", S, I, N, ", :, A, =, 2, \Rightarrow , Prog, ", C, O, S, ", :, Goto, 1

This program executes the program under filename "SIN" when I is pressed, and the program under filename "COS" when I is pressed. Write the following two programs in the files.

Filename "SIN"

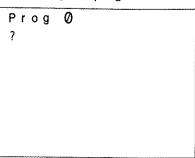

Cls, :, Range, (-), 3, 6, 0, \cdot , 3, 6, 0, \cdot , 1, 8, 0, \cdot , (-), 1, \cdot , 6, \cdot , 1, \cdot , 6, \cdot , 0, \cdot , 5, :, Graph, sin, \times , \checkmark

Filename "COS"

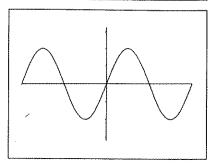

Cls, ∶, Graph, cos, X, ⊿

Press MODE 11 to return to the RUN mode after writing the programs.

Prog () EXE

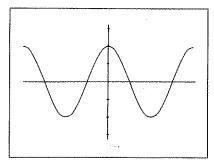

1 EXE

Pressing EXE again returns to the key input mode and displays the "?" prompt.

2 EXE

5-6 FILE EDITOR MODE KEYS

Key input in the file editor mode differs from that during normal operation to allow easier entry of alphabetic characters.

① Direct — Entry of upper-case alphabetic characters

② SHIFT Displays **S** and locks alphabet keys as lower-case until pressed again.

③ □ Displays ▲ and locks keys for input of commands/ functions marked on key tops until pressed again.

④ ALPHA SHIFT — Displays ▼ and changes keys for input of commands/ functions marked in brown on key panel.

Ex.

$$\begin{array}{ccc}
 & & & \\
\hline
0 & & & \\
\hline
z & & & \\
\hline
0 & & & \\
\hline
z & & & \\
\hline
0 & & & \\$$

The following special keys should also be noted:

KEY	FUNCTION	CONDITION
AC	\$ (COMMAND INPUT)	1 ~ 4
Prog	" (APOSTROPHE)	2
×	*	4
[·••]	/	4
Graph Range G→7	Tab keys	1/2

The insert key () indicates the insert location using a different symbol for each condition:

- ①[]
- 2 [7
- 3 ×

5-7 FILE EDITOR ERROR MESSAGES

The following error messages appear on the display to indicate improper operation.

• Data Full !!

Displayed when an attempt is made to create a new file when the number of remaining steps is insufficient. Use the DEL or DELA command to erase unnecessary files from memory and reattempt.

• illegal command

"illegal" stands for "irregular algorithm" and is displayed when an attempt is made to enter a command which does not exist. This message usually indicates that quotation marks have not been used for a filename, or an improper input key mode. Press to check command menu for proper command and reattempt.

• illegal name

Displayed when an attempt is made to create a new file under a filename in which the first character is not an upper-case alphabetic character or spaces are included. Change filename.

cannot find

Displayed when element specified in S command or L command cannot be found.

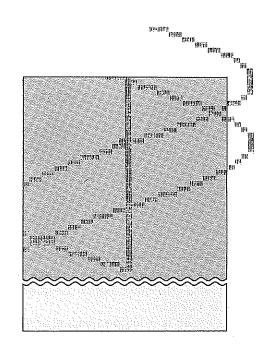

did not pass

Displayed when an attempt is made to call a file and entered password does not match the password assigned to the file. Enter proper password.

File not found

Displayed when an attempt is made to use LIST "filename" E EXE to enter of a non-existent filename or to call a non-existent filename using a subroutine. Use D command to confirm filename and reattempt.

6. USEFUL OPTION

6-1 PRINTER INTERFACE

A Centronics standard printer or plotter-printer can be used to print out programs, or graphs. The print functions are divided among four major divisions.

(1) Data print function

② List function

- · Alphabetic characters
- Numeric values
- Computation results
- Memory contents
- Single program list
- All program lists
- Memory lists
- Statistical data lists
- Graph range list
- Single file list
- All file lists
- ③ Graph copy function (Graphic printer only)
- Graphic screen copy
- 4 Plotter function (Plotter printer only)
- Single graphMultiple graphs
- Lines

The FA-80 interface unit provides even more performance from the fx-8500G. No other option besides the FA-80 should be used with the fx-8500G.

The FA-80 is equipped with a printer interface which allows printout of computation results, program lists, and graphs. Either a Centronics standard printer or plotter-printer can be connected.

Suggested printer: CASIO FP-40

* When using a plotter-printer, use a CASIO FP-100.

The cassette interface of the FA-80 allows connection of a cassette recorder for saving and loading programs created on the fx-8500G.

Data print function

Data can be printed out by entering SHIFT Ans data EXE.

• Special character table

The following shows the printout for fx-8500G characters that are not included in the ASCII code character set.

-					
DISPLAY	PRINT	DISPLAY	PRINT	DISPLAY	PRINT
E	E	₹	Cur	x	Mx
×	*	П	(10) ^	\ddot{y}	Му
÷	/ /	o	,	xσn	SDxn
1	ு Disp	π	Pi	yon	SDyn
2	^2	0	deg	<i>xo</i> n−1	SDx
sin ⁻¹	arc sin	r	rad	yσn-1	SDy
cos ⁻¹	arc cos	g	gra	A	а
tan ⁻¹	arc tan	≥	>=	В	b
sinh ⁻¹	arc sinh	S	==<	ŵ	Ex
cosh ⁻¹	arc cosh	+	<>	ŷ	Ey
tanh ⁻¹	arc tanh	⇒	=>	μ	micro
x^{y}	x ^	DT*	Dt		>
*	Root	CL*	CI		1
	Sqr	()	()		7-4-1
		x-1	^(-1)		<u> </u>

Hexadecimal values are printed within curly braces.

* Actually not displayed

① Data print

Data which can be printed are alphabetic characters, numeric values, formulas, and variables. Alphabetic characters are printed left flush, while numeric values are printed right flush. Alphabetic character strings for printing are enclosed in parentheses.

Ex. ABCDE (Alphabetic character string)

ABCDE

Ex. 1.23×10⁹⁹ (Numeric value)

Ex. 123+sin 30° (Formula)

Ex. Variable A contents (Variable)

2 Chaining data

Multiple data items can be chained for continuous printing as follows.

1. A linefeed is output for a comma used as a print data delimiter.

Ex.

$$\frac{P_{fint}}{Ans}$$
 123 SHIFT , 123 SHIFT , 123 EXE

	 	1	
123.			
123.			
123.			

2. A 16-character space is allocated for data items delimited by a semicolon. Spaces are inserted when the actual data item is less than 16 characters long.

Print data; data; data; . . .

Ex.

 $\begin{array}{c} \text{SHIFT} \stackrel{Print}{\text{Ans}} \ 123 \ \text{SHIFT} \ \vdots \ 123 \ \text{SHIFT} \ \vdots \ 123 \ \text{EXE} \end{array}$

16-characters 123.	123.
123.	

3 Tab function

The number of spaces entered by the tab function during printing can be specified.

Print $\langle n \rangle$ data $\stackrel{\text{EXE}}{=} \dots n$ spaces from beginning of line. Applied only to the first data item (in the case of multiple items).

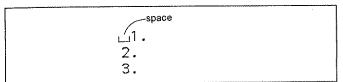

n =integer in range of $0 \le n \le 80$

Print [n] data, data, ... EXE ... Used with multiple data items to specify n spaces from the beginning of each data item.

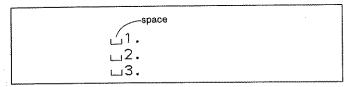

Ex. Print 1, 2, 3

Print (1) 1, 2, 3

Print [1] 1, 2, 3

4 Carrier return/line feed command

Carrier return/line feed can be entered as required.

Print EXE . . . Single line feed

Carrier return/line feed can be embedded in data chains by including the Print command (delimited by colons) between data items.

Ex. Print 123, 456 : Print : Print 789

123. 456. 789.

■ List function

The LIST command is used to print out a program list, memory contents, or file contents. List is composed of the following five functions:

- 1. Program list
- Single program
- All programs
- 2. Memory list
- 3. Statistical data list Single-variable statistical data
 - · Paired-variable statistical data
- 4. Graph range list
- 5. File list
- Single file
- All files
- * One space must be included following the LIST command.
- * "L." can be used as an abbreviation of "LIST". In this case, a space is not required following "L.".
- *The LIST command cannot be used within multistatements or in a program.

① Program list

Single program

The list for the program stored in a specified area can be printed.

LIST
$$\sqsubseteq$$
 "title" Prog n (n =integer in range of $0 \le n \le 9$)

Titles assigned to programs are enclosed in quotation marks. Titles may be omitted.

* A carrier return is output to the printer wherever a carrier return or display command (A) is included within the program.

All programs

Lists of all programs currently stored is printed when the program area is not included in the LIST command.

^{*} Entering a wrong argument in the Base-n mode causes the erroneous part of the argument to be printed out enclosed in curly braces.

② Memory list

Specifying the M option produces a printout of a memory list.

(Titles may be omitted.)

- * Printout in the Base-n mode is performed using the proper notation for each value. The message "out of range" is printed when a value is outside of a range of the specified notation.
- (3) Statistical data list

Single-variable statistical data list

Prints basic statistics for data input in the single-variable statistics modes (SD1, SD2). In this case, S must be specified after the LIST command.

(Title may be omitted.)

- * The statistical memory (frequency memory) contents are printed in the SD2 mode.
- * The message "cannot calculate" is printed when the required statistics are not present.
- Paired-variable statistical data list

Prints basic statistics values for data input in the paired-variable statistics modes (LR1, LR2). In this case, S must be specified after the LIST command.

(Titles may be omitted.)

- * The message "cannot calculate" is printed when the required statistics are not present.
- * Attempting to print statistical data in any other mode besides the statistical modes (SD1, LR1, SD2, LR2) results in a Syn ERROR.
- ④ Graph range list

Specifying R after the LIST command prints the currently specified graph range.

(Title may be omitted.)

* Attempting to print the graph range list while in the Base-n mode results in a Syn ERROR.

- ⑤ File list
- Single file list

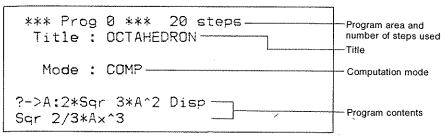

Specifying a filename prints out the list for the specified file.

LIST
$$\sqsubseteq$$
 " filename " E

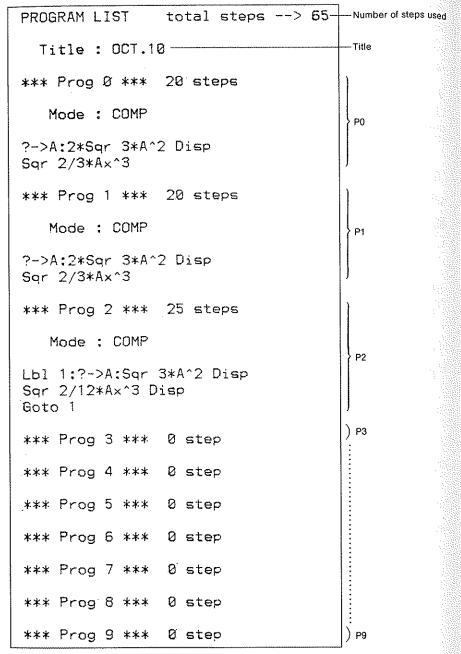

- * Filenames are enclosed in parentheses.
- All file list

Lists for all files present in memory are printed when the filename is omitted.

- *List cannot be produced by files to which passwords are assigned (indicated by -*-).
- List samples
- 1. Single program list

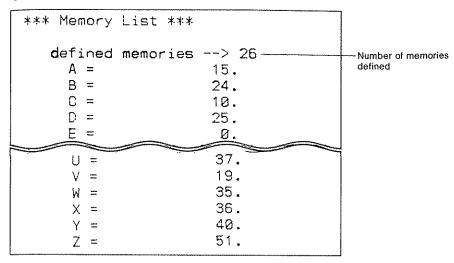

2. All program list

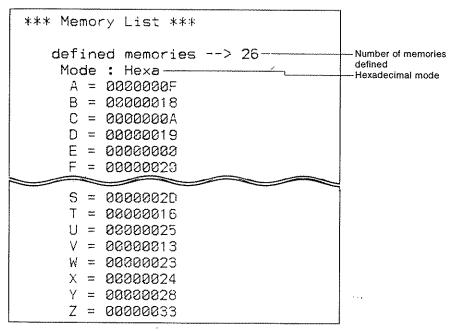

3. Memory list

a. COMP mode

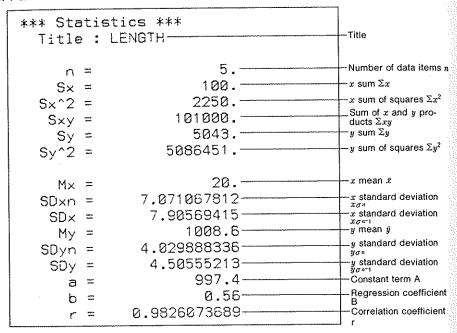

b. Base-n hexadecimal mode

4. Single-variable statistical list

*** Statis Title :	tics *** TEST	Title
n = Sx = Sx^2 =	8. 427. 22805.	Number of data items n Sum Σx Sum of squares Σx^2
Mx = SDxn = SDx =	53.375 ———— 1.316956719 ———— 1.407885953 ————	Mean x Standard deviation σπ Standard deviation σπ-1

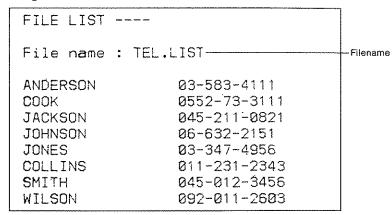

5. Paired-variable statistical list

6. Graph range list

*** Range Title :	List *** SINE	Title
Xmin = max = scl = Ymin = max = scl =	-360. 360. 180. -1.6 1.6 0.5	

7. Single file list

8. All file list

	FILE LIST	***
***************************************	File name : TEL.LIST	Filename
	ANDERSON 03-583-4111 GOOK 0552-73-3111 JACKSON 045-211-0821 JOHNSON 06-632-2151 JONES 03-347-4956 COLLINS 011-231-2343 SMITH 045-012-3456 WILSON 092-011-2603	
	File name : SALES	Filename
	A 1500 B 2350 C 930 D 5480 E 3200 F 7460	
	File name : SECRET -*-	Password file

Graph copy functions

Copies of graphics shown on the display can be printed out using a Centronics standard graphic printer. The four following types of copies are possible:

- 1. Normal copy
- 2. Framed copy
- 3. Reverse copy
- 4. Vertical enlarged copy
- * The copy commands cannot be used with a plotter-printer.
- * Copies of text cannot be printed.

(1) Print density specification

The graph print switch is used to specify one of two densities for graph copy.

- N: Sets graph printout at same dot configuration as used on the graphic screen (96 \times 64). A single screen dot is actually represented by four printer dots.
- HD: Sets graph printout to use double the number of dots on the display (192×128).
- * The display is the same in the N mode and HD mode. However, the HD mode is set internally for double the density of the N mode, making printout comparatively slower.

2 Graph copy procedure

The Print command is used to produce a copy of the graph currently shown on the display.

a. Normal copy

Prints a copy of the graph currently shown on the display as it is.

Print-G

- * The minus key is used to enter "-".
- b. Framed copy

Prints a copy of the graph currently shown on the display, and encloses it in a frame.

Print-GW

c. Reverse copy

Prints a reversed copy of the graph currently shown on the display.

Print-GR

d. Vertical enlarged copy

Prints a copy rotated 90 degrees of the graph currently shown on the display. The printed copy is approximately twice the size of the other type of copy.

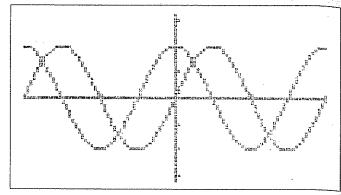

Print-GS

* The copy commands can be used within programs.

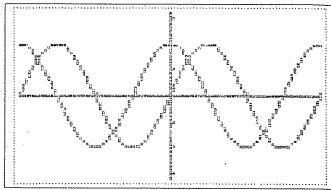

\blacksquare Graph copy samples (Graph $y=\sin$)

1. Normal copy

Print—G

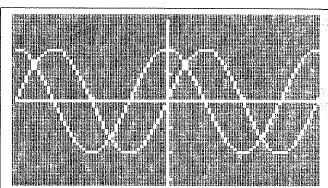

2. Framed copy
Print—GW

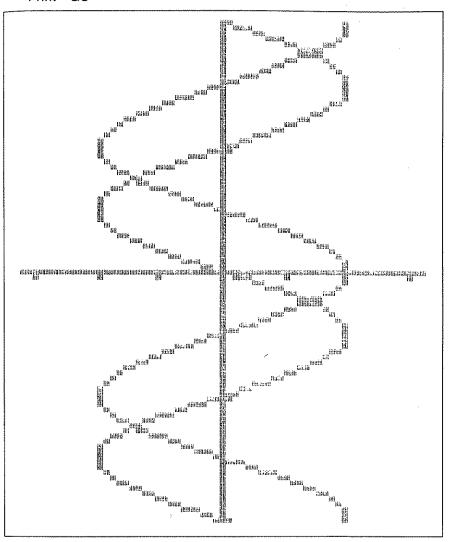

3. Reversed Copy

Print—GR

4. Vertical copy

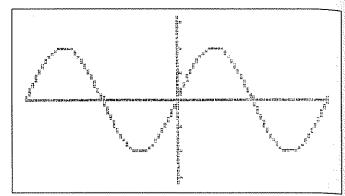

Print-GS

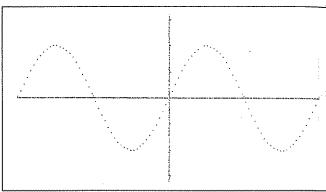

Graph print density

The print density of the print graph can be controlled by combinations of the display graph density and print graph density specifications.

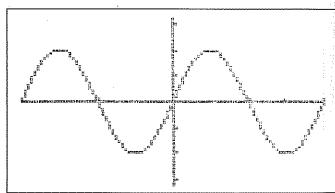

1. Display: N Print: N

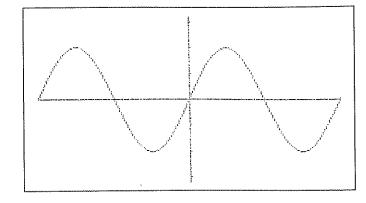

2. Display: N Print: HD

3. Display: HD Print: N

4. Display: HD Print: HD

Plotter functions

Graphic screens can be printed out using a plotter printer. The plotter printer makes it possible to produce copies of graphs almost as soon as they are displayed. The three plotter functions are as follows:

- 1. Single graph print
- 2. Multiple graph overwrite print
- 3. Line print
- * Plotter functions cannot be used with a graphic standard printer.
- * Text cannot be printed.

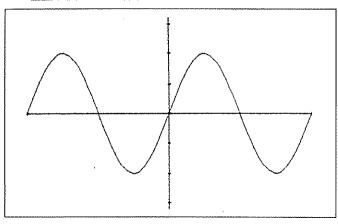

(1) Single graph print

Single graphs can be printed as displayed.

Print Graph expression

Ex. Print Graph $y = \sin x$

SHIFT Ans Graph Sin EXE

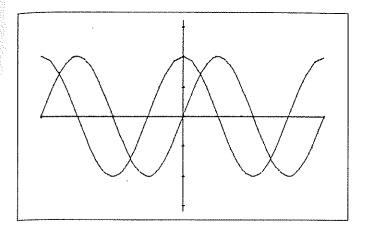

2 Multiple graph overwrite print

Multiple graphs can be overwritten by specifying multiple expressions separated by semicolons.

Print Graph expression; Graph expression . . .

Ex. Overwrite Graph $y = \sin x$ and Graph $y = \cos x$

(3) Line print

Plots two points on the display and prints a straight line connecting the two points, along with axes.

Print line

Ex. Print a line between coordinates (90, 1) and (-90, -1) for the graph range listed below.

SHIFT Ans SHIFT Line EXE

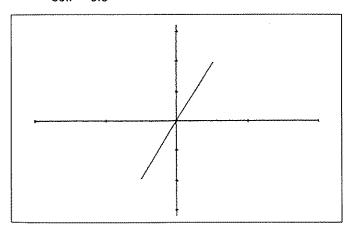

SHIFT Mais 90 SHIFT 1 EXE Xmin: -360 SHIFT Dop (-) 90 SHIFT . (-) 1 EXE

360 max:

csl: 180

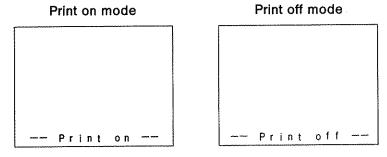

Ymin: -1.6

1.6 max: scl: 0.5

Print mode

The print ON mode makes it possible to print out input characters and computation results without using the Print command. Each press of MODE switches between the print on and print off modes. The current status of the print mode is displayed on the bottom line of the display for approximately two seconds after the mode is switched.

Ex.

MODE EXP (Print on mode)

123 ⊠ 456 EXE

123*456 56088.

In the statistical modes (SD1, LR1, SD2, LR2), entered data are printed followed by Dt, while deleted data are printed followed by Cl.

Ex.

123 DT

456 CL

1		
	123Dt	123.
	45601	, 201
***************************************		456.

Error messages are printed to indicate when errors are generated during printing.

Ex.

123 ± 0 EXE

123/0 Ma ERROR Step 5

Pen color specification

The pen color for printing can be specified when an MSX graphic printer or plotter-printer is being used.

-1. MSX graphic printer

One of eight different colors can be specified.

2. Plotter-printer

One of four different colors can be specified.

^{*} The minus key is used to enter "--".

6-2 CASSETTE INTERFACE

Programs and data can be saved to and loaded from cassette tapes for storage. The following three commands are used for these operations.

SAVE: Records programs or memory contents from computer to cassette tape.

LOAD: Loads programs or memory contents from cassette tape to computer.

VERIFY: Confirms proper SAVE operations by checking whether data saved to cassette tape are identical to those in the computer's memory.

Command formats

SAVE

Format	Function
SAVE " filename " Prog n	Saves program in program area n to cassette tape. Filename may be omitted, and n = integer in range of $0 \le n \le 9$.
SAVE " filename " Prog	Saves all programs present to cassette tape. Filename may be omitted.
SAVE _ " filename " M	Saves memory contents to cassette tape. Filename may be omitted.
SAVE " message "	Saves specified message (16 characters maximum) to cassette tape. Usually used for dates or remarks.
SAVE _ " filename " G	Saves currently displayed graphics along with graph range to cassette tape. Filename may be omitted.
SAVE " filename " E	Saves file specified by filename to cassette tape. Omitting filename saves all files present. "File not found" error generated when specified file non-existent.
SAVE " filename " A	Saves entire RAM contents to cassette tape. Filename may be omitted.

^{* &}quot;0." is displayed when SAVE operations are complete.

● LOAD

Format	Function
LOAD பூ " filename " Prog <i>n</i>	Loads program specified by filename which is stored in file saved using SAVE "filename" Prog from cassette tape to program area n . "already exist" error generated and load not performed if program already exists in area n . Performing load for programs saved using SAVE "filename" Prog, loads the first program in the file. Filename may be omitted, and $n=$ integer in range of $0 \le n \le 9$.
LOAD 🔟 " filename " Prog	Loads programs in file specified by file- name from cassette tape to lowest free program area available. "Area Used!!" dis- played and further load impossible when number of programs exceeds available areas. Filename may be omitted.

* With the two formats above, program load to available areas is performed as long as total remaining memory capacity is large enough to store the program being loaded. Load is terminated at any point where total remaining memory capacity is insufficient for the next program to be loaded, even though a program area is available.

LOAD " filename " M	Loads memory contents specified by file- name from cassette tape sequentially, start- ing from computer memory A. "already ex- ist" displayed and LOAD operations termin- ated when data already exist in computer memory. In this case, clear memory con- tents and attempt load again. If the number of memories on tape exceeds that available in computer, load is terminated after all computer memories are used. Filename may be omitted.
LOAD " message "	Loads specified message from cassette tape. Message must be enclosed in quotation marks.

^{*} A space must always follow immediately after the SAVE command.

LOAD 🗀 " filename " G	Loads graphics specified by filename from cassette tape. Any graphics displayed before load operation are deleted and replaced with loaded graphics. Loaded graphics can be viewed by pressing feet load operation is complete. Filename may be omitted.
LOAD " filename " E	Loads file specified by filename from cassette tape. Filenames of recorded files displayed until specified file located on tape. Omitting filename sequentially loads files from cassette tape in the order they are stored. First file located is loaded, and LOAD operation suspended until EXE is pressed.
LOAD " filename " A	Loads RAM contents specified by filename from cassette tape. Filename may be omitted.

^{* &}quot;0." is displayed when LOAD operations are complete.

VERIFY

Format	Function
VERIFY " filename " Prog n	Performs parity check between program stored in program area n and program stored on cassette tape. Filename may be omitted.
VERIFY " filename " Prog	Performs parity check between program stored in memory and program saved to cassette tape using SAVE "filename" Prog. Filename may be omitted.
VERIFY " filename " M	Performs parity check between current memory contents and memory contents stored on cassette tape. Filename may be omitted.
VERIFY " message "	Performs parity check between specified message and message stored on cassette tape. Message must be enclosed in quotation marks.

VERIFY _ " filename " G	Performs parity check between currently displayed graphics and graphics stored on cassette tape. Filename may be omitted.
VERIFY " filename " E	Performs parity check between file contents specified by filename and file on cassette tape. Filename omitted to verify file saved without specifying filename.
VERIFY " filename " A	Performs parity check between RAM contents of computer and RAM contents of cassette tape. Filename may be omitted.

^{* &}quot;0." is displayed when VERIFY operations are complete.

Filenames

Filenames are saved along with the programs and memory contents to which they are assigned. Therefore, specific programs or memory data are loaded by specifying the filename with the LOAD command.

- * Filenames must be enclosed in quotation marks.
- * Filenames are limited to 16 characters in length, and the first character must be an upper-case alphabetic character.
- * Spaces cannot be used within filenames.
- * Executing the LOAD command without specifying a filename loads the first data on the cassette tape with the same attributes.
- * A "type mismatch" error is generated when an attempt is made to load data with the same filename but different attributes.

^{*} A space must always follow immediately after the LOAD command.

^{*} A space must always follow immediately after the VERIFY command.

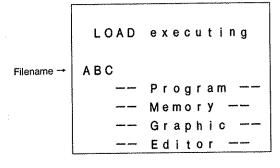

^{*} The abbreviation VER may be used in place of VERIFY.

M Command displays

SAVE

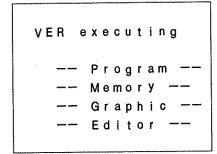

- ← Program
- ← Memory
- Graphics
- - * Shows attributes being saved.

LOAD

- * Shows filename and attributes being loaded.
- * " -- " displayed when filename is not assigned.

VERIFY

* Shows attributes being verified.

6-3 OPTION ERROR MESSAGES

The following error messages are displayed when improper operation is attempted using a printer or cassette recorder via the optional FA-80 interface unit.

Printer

① I/O ERROR

Improper connection to the FA-80 interface unit. Switch computer power OFF, and disconnect it from the FA-80. Carefully reconnect the two units and switch computer power ON again.

(2) PRT ERROR

Print command sent from computer while the printer mode switch is set to LOCAL. Set the printer mode switch to ON LINE.

Cassette recorder

1) Already exists

Attempt made to load to memory which already contains data or to load a file with a filename which already exists in memory. Perform the memory all clear operation or delete the file with the same filename before loading.

(2) No contents

Attempt made to perform program save when nothing exists in the program area.

3 Read ERROR

Tape stopped during LOAD or VERIFY operations, or tape being used is defective. Reattempt LOAD or VERIFY operation.

4 Area used

Attempt made to perform program load when program areas P0 through P9 are already full. Delete unnecessary program.

5 too large size

Program, file or memory capacity smaller than data being loaded. Increase available memory by deleting unnecessary programs or files.

6 Verify ERROR

Attempt made to verify data with same attributes but different contents. Check computers programs, file, and memory contents.

7 type mismatch

Attempt made to load data with same filename but different attributes. Confirm attributes of specified filename or check tape counter.

LIST command

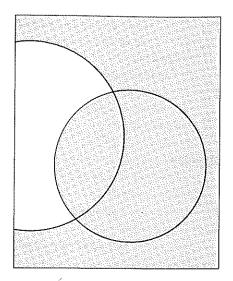

(1) cannot calculate

Printed when an attempt is made to print statistics without entering required statistical data.

2 out of range

Printed when a value in memory exceeds the digit limitation (i.e. data entry in Base-n hexadecimal mode and memory list in binary mode). Confirm memory contents.

PROGRAM LIBRARY

(Prior to use)

- Always check the number of remaining steps before attempting to store programs.
- The library is divided into two parts: a calculation section and a graph section. The calculation section shows only answers, while the graph section shows whole displays.
- Press the Graph key whenever "Graph" appears within a program (Graph Y = indicated).
- If it is necessary to specify a calculation mode (e.g. Base-n, SD1) in a program, be sure to specify it after pressing MODE 2 (WRT mode).

Then start programming by pressing EXE.

CASIO PROGRAM SHEET

Program for Prime factor analysis No. 1

Description

Prime factors of arbitrary positive integers are produced.

For $1 < m < 10^{10}$

prime numbers are produced from the lowest value first. "END" is displayed at the end of the program.

(Overview)

m is divided by 2 and by all successive odd numbers (d = 3, 5, 7, 9, 11, 13,.....) to check for divisibility.

Where d is a prime factor, $m_i = m_{i-1}/d$ is assumed, and division is repeated until $\sqrt{m_i} + 1 \le d$.

Example

(1)

 $119 = 7 \times 17$

(2)

 $1234567890 = 2 \times 3 \times 3 \times 5 \times 3607 \times 3803$

(3)

 $987654321 = 3 \times 3 \times 17 \times 17 \times 379721$

Program for

No. 2 Greatest common measure

Description

Euclidean general division is used to determine the greatest common measure for two integers a and b.

For |a|, $|b| < 10^9$, positive values are taken as $< 10^{10}$

(Overview)

$$n_0 = \max (|a|, |b|)$$

$$n_1 = \min (|a|, |b|)$$

$$n_k = n_{k-2} - \left(\frac{n_{k-2}}{n_{k-1}}\right) n_{k-1}$$

$$k = 2, 3 \dots$$

If $n_k = 0$, then the greatest common measure (c) will be n_{k-1} .

Example

When

$$a = 23345$$

$$a = 522952$$

$$b = 374$$

$$b = 9135$$

$$b = 3208137866$$

$$c = 1015$$

$$c = 998$$

Program for

Definite integrals using Simpson's rule

3

Description

$$I = \int_{a}^{b} f(x)dx = \frac{h}{3} |y_0 + 4(y_1 + y_3 + \dots + y_{2m-1}) + 2(y_2 + y_4 + \dots + y_{2m-2}) + y_{2m}|$$

$$h = \frac{b-a}{2m}$$

The right-hand portion of the above equation can be transformed as follows.

$$1 = \frac{h}{3} \left\{ y_0 + \sum_{i=1}^{n} \left(4y_{2i-1} + 2y_{2i} \right) - y_{2m} \right\}$$

Let
$$f(x) = \frac{1}{x^2 + 1}$$

Example

$$\langle 1 \rangle \ a = 0 , b = 1 , 2 m = 10$$

$$I = \int_0^1 \frac{1}{x^2 + 1} d_x = 0.7853981537$$
 $\langle 2 \rangle \ a = 2 , b = 5 , 2 m = 20$

$$I = \int_{2}^{5} \frac{1}{x^2 + 1} d_x = 0.2662526769$$

CASIO

PROGRAM SHEET

Program for

Minimum loss matching

No.

5

Description

Calculate R_1 and R_2 which match Z_0 and Z_1 with loss minimized. $(Z_0 > Z_1)$

$$Z_0 \longrightarrow R_1 \longrightarrow Z_0 \longrightarrow R_2 \longleftarrow Z_1 \longrightarrow Z_1 \longrightarrow Z_2 \longrightarrow Z_2$$

$$R_1 = Z_0 \sqrt{1 - \frac{Z_1}{Z_0}}$$
 $R_2 = \frac{Z_1}{\sqrt{1 - \frac{Z_1}{Z_0}}}$

Minimum loss
$$L_{min} = 20 \log \left(\sqrt{\frac{Z_0}{Z_1}} + \sqrt{\frac{Z_0}{Z_1} - 1} \right) [dB]$$

Example

Calculate the values of R_1 , R_2 and L_{min} for $Z_0 = 500 \Omega$ and $Z_1 = 200 \Omega$.

Preparation and operation

- Store the program written on the next page.

 Execute the program as shown below in the RUN mode (MODE 11).

CASIO

PROGRAM SHEET

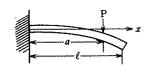

Program for

Cantilever under concentrated load

No.

6

Description

E: Young's modulus (kg/mm²)

I : Geometrical moment of inertia (mm4)

a: Distance of concentrated load from support (mm)

P: Load (kg)

x: Distance of point of interest from the support (mm)

Deflection y (mm), Angle of deflection s (*), Bending moment M (kg · mm)

(i)
$$\ell > x > a$$

$$y = \frac{Pa^3 - Pa^2}{6EI - 2EI}x$$

$$s = \tan^{-1} \left(-\frac{Pa^2}{2EI} \right)$$

② $x \leq a$

$$y = \frac{P}{6EI}x^3 - \frac{Pa}{2EI}x^2$$

$$s = \tan^{-1} \left(-\frac{Pa^2}{2EI} \right) \qquad \qquad s = \tan^{-1} \left(\frac{Px}{2EI} (x - 2a) \right)$$

Example

M = 0 (shearing load Ws = 0)

M = P(x - a) (shearing load Ws = P)

 $E = 4000 \text{ kg/mm}^2$

 $I = 5 \text{ mm}^4$

a = 30 mm

P = 2 kg

What are deflection, angle of deflection, bending moment and shearing load at x = 25 mm and x = 32 mm?

Preparation and operation

Store the program written on the next page.

● Execute the program as shown below in the RUN mode (MODE []).

PROGRAM SHEET

Program for Parabolic movement	No. 7
--------------------------------	-------

Description

$$x = (V_0 \cos a) \cdot t$$

$$y = (V_0 \sin a) \cdot t - \frac{1}{2}gt^2 + h$$

$$g = 9.8 \, (\text{m/s}^2)$$

 V_0 (m/s)

a (°)

Δ t (sec.)

h (m)

Example

Initial velocity $V_0 = 130 \, (m/sec.)$

Initial angle a = 25 (°)

Height h = 0 (m)

 $\Delta t = 0.5 \text{ (sec.)}$

Plot the trace of movement in intervals of Δt .

Preparation and operation

● Store the program written on the next page.
● Execute the program as shown below in the RUN mode (MODE ①).

Program for

Normal distribution

No.

8

Description

Obtain normal distribution function $\phi(x)$ (by Hastings' best approximation).

$$\phi(x) = \int_{-\infty}^{1} \phi \, t dx$$

$$\phi t = \frac{1}{\sqrt{2\pi}} e^{-\frac{x^2}{2}}$$

Put
$$t = \frac{1}{1 + Px}$$

$$\phi(x) = 1 - \phi t (c_1 t + c_2 t^2 + c_3 t^3 + c_4 t^4 + c_5 t^5)$$

$$P = 0.2316419$$

$$C_3 = 1.78147937$$

$$C_1 = 0.31938153$$

$$C_4 = -1.821255978$$

$$C_2 = -0.356563782$$

$$C_5 = 1.330274429$$

Example

Calculate the values of $\phi(x)$ at x = 1.18 and x = 0.7.

Preparation and operation

PROGRAM SHEET

Program for Circle and points of tangency 9

Description

Circle formula $x^2+y^2=r^2$ Formula for tangent lines passing through point A (x', y') y-y'=m(x-x')* m is the tangent line slope

Draw a line from point A (x', y') to a circle with radius r, and determine the slope m and intercept b (=y'-mx'). Also, read the coordinates of the tangent using the trace function, and use the factor function to magnify the graph.

Example

(NOTE)

• r=x' generates an Ma ERROR.

Preparation and operation

Store the program written on the next page.

CASIO PRO

PROGRAM SHEET

Program for Rotation of figures No. 10

Description

Coordinate conversion formula $(x, y) \rightarrow (x', y')$ $x' = x \cos \theta - y \sin \theta$ $y' = x \sin \theta + y \cos \theta$

Draw a figure that represents a degree rotation of a triangle.

Example

Draw the figure of the triangle (A (2, 0.5), B (6, 0.5), C (5, 1.5)) rotated 45°

(NOTE)

- The blinking point can be moved using the cursor keys.
- To terminate the program, press the AC key during graph display.
- \bullet A triangle cannot be drawn if the converted coordinates (E' (set the value of x to 5.)) exceed the preset range values.

Preparation and operation

Store the program written on the next page.

PROGRAM SHEET

Program for

Graph variation by parameters

No.

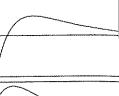

Description

Damped vibration

(i) $\varepsilon > n$ (Overdamping)

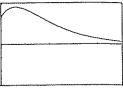

$$P_{1} = -\epsilon + \sqrt{\epsilon^{2} - n^{2}} , P_{2} = -\epsilon - \sqrt{\epsilon^{2} - n^{2}}$$

$$x = \frac{v_{0} - x_{0}P_{2}}{P_{1} - P_{2}} e^{P_{1}r} - \frac{v_{0} - x_{0}P_{1}}{P_{1} - P_{2}} e^{P_{2}r}$$

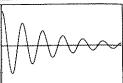

11

(ii) ε=n (Critical damping) $x = |x_0 + (v_0 + \varepsilon x_0)t|e^{-t}$

(iii) € < n (Damping vibration)

$$x = e^{-t} |x_0 \cos \sqrt{n^2 - \varepsilon^2} t + \frac{v_0 + \varepsilon x_0}{\sqrt{n^2 - \varepsilon^2}} \cdot \sin \sqrt{n^2 - \varepsilon^2} t|$$

Example

Draw a graph of the damping vibration that possesses the following parameters:

(1)
$$\varepsilon = 0.1$$

(2)
$$\varepsilon = 0.2$$

(3)
$$\epsilon = 0.2$$

$$n = 1.5$$

$$n = 0.2$$

$$n = 0.18$$

$$x_0 = 2.5$$

$$x_0 = 2$$

$$x_0 = 2.5$$
 $x_0 = 2$ $x_0 = -2$

$$v_0 = 1$$

$$v_0 = 0.6$$

$$v_0 = 1.5$$

Preparation and operation

PROGRAM SHEET

Program for Hysteresis loop No. 12

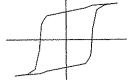

Description

When a ferromagnetic specimen is sustained in a magnetic field, the specimen becomes magnetized. The B-H relationship can be represented by a hysteresis curve.

Soft magnetic substance

Ferromagnetic substance

Example

Hysteresis curve of soft magnetic material

PROGRAM SHEET

Program for Regression curve No. 13

Description

i Logarithmic regression curve Regression formula: $y = A + B \ln x$

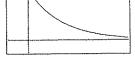

$$B = \frac{n \cdot \sum (y \cdot \ln x) - \sum \ln x \cdot \sum y}{n \sum (\ln x)^2 - (\sum \ln x)^2}$$

ii Exponential regression curve Regression formula: $y = A \cdot e^{Ax}$

$$B = \frac{n \sum (x \ln y) - \sum x \cdot \sum \ln y}{n \cdot \sum x^2 - (\sum x)^2}$$

$$A = e\left(\frac{\sum \ln y - B \cdot \sum x}{n}\right)$$

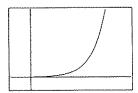

iii Power regression curve

Regression formula: $y = A \cdot x^{B}$

$$B = \frac{n \sum (\ln x \cdot \ln y) - \sum \ln x \cdot \sum \ln y}{n \cdot \sum (\ln x)^2 - (\sum \ln x)^2}$$

$$A = \frac{\sum \ln y - B \cdot \sum \ln x}{n}$$

CASIO PROGRAM SHEET

Program for Regression curve No. 13

Example

Perform exponential regression of the following data:

хi	2.2	5.6	9.5	13.8	18.0	23.2	29.9	37.8
уi	35.6	28.1	23.0	17.9	12.9	10.2	6.2	4.0

Draw an exponential regression curve, and use the trace function to estimate the value for y when X=20. Also, obtain the values of A and B of the regression formula.

Range values:

Preparation and operation

• Store the program written on the next page.

PROGRAM SHEET

No. Program for Parade diagram 14

Description

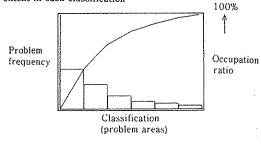

One example of a parade diagram application is problem solving in QC activities. The problem is quantitatively analyzed based on actual data concerning its extent, and the main points demanding attention are determined.

Horizontal axis: Problem classification

(Item 6 in this example)

Vertical axis: (Right) Occupation ratio

(Left) Problem extent in each classification

Example

Create a parade diagram using the data on the right.

Problem areas	Frequency
A	105
В	65
С	35
D	20
E	15
Others	10

REFERENCE MATERIAL

Manual computations

Mode speci- fication	COMP mode	Four arithmetic computations and function computations.				
	Base-n mode (MODE □)	Binary, octal, decimal, hexadecimal conversions and computations, logical operations.				
	SD1 mode (MODE⊠)	Standard deviation computations (1-variable statistical computations).				
	LR1 mode (MODE ⊕)	Regression computations (paired variable statistical computations).				
	SD2 mode (SHIFT MODE ⊠)	For production of single variable statistical graphs. (Bar graphs, line graphs, normal distribution curves)				
	LR2 mode	For production of paired variable statistical graphs. (Regression lines)				
Functions	Type A functions	Function command input immediately before numeric value. (sin, cos, tan, sin ⁻¹ , cos ⁻¹ , tan ⁻¹ , sinh, cosh, tanh, sinh ⁻¹ , cosh ⁻¹ , tanh ⁻¹ , log, ln, e^x , 10^x , $\sqrt{}$, $3\sqrt{}$, Abs, Int, Frac				
	Type B func- tions	Function command input immediately after numeric value. $(x^2, x^{-1}, x!)$				
	Paired variable functions	Function command input between two numeric values. Numeric value enclosed in parentheses input immediately after function command. (A x^y B (A to the Bth power), B $\sqrt[x]{}$ A (A to the 1/Bth power), Pol (A,B), Reç (A,B) * A and B are numeric values.				
	Immediately executed functions	Displayed value changed with each press of a key. (ENG, ENG, *, '')				

	Binary, octal, decimal, hex- adecimal computations	Setting num- ber system	
THE PROPERTY OF THE PROPERTY O		Number system specification	Number system for the numeric value entered immediately after can be specified regardless of the currently set number system. To specify: Decimal \cdots SHIFT d ($d = \sqrt{}$) Hexadecimal \cdots SHIFT d ($d = \sqrt{}$) Binary \cdots SHIFT d ($d = \sqrt{}$) Octal \cdots SHIFT d ($d = \sqrt{}$)
		Logical opera- tions	A input numeric value converted to binary and each bit computed. Result converted back to number system used for input, and then displayed. Not Reverse of each bit and Logical product of each bit or Logical sum of each bit xor Exclusive logical sum of each bit
- 1	Standard de-	Data clear	SHIFT ScI EXE (ScI = AC)
- 1	viation com- outations	Data input	Data (;frequency) DT (DT = 4T) * Frequency can be omitted.
		Data deletion	Data (;frequency) CL (CL = x²) * Frequency can be omitted.
		Result display	Number of data (n)

Regression	Data clear	SHIFT ScI EXE (ScI = AC)
computations	Data input	x data, y data (; frequency) DT ($DT = \sqrt[x]{}$) * Frequency can be omitted.
	Data deletion	x data, y data (;frequency) CL ($CL = x^y$) * Frequency can be omitted.
		* Frequency can be omitted.
	Result display	Number of data (n)
		Sum of x (Σx)
		Sum of y (Σy)
		Sum of squares of x ($\sum x^2$)
		Sum of squares of y ($\sum y^2$)
		Sum of products of x and y ($\sum xy$)
		Mean of $x(\bar{x})$ SHIFT \bar{x} EXE (\bar{x} = 11) Mean of $y(\bar{y})$ SHIFT \bar{y} EXE (\bar{y} = 4)
		Population standard deviation of x
		(x_{σ_n}) SHIFT x_{σ_n} EXE $(x_{\sigma_n} = 2)$
		Population standard deviation of y
		(y_{σ_n}) SHIFT y_{σ_n} EXE $(y_{\sigma_n} = 5)$
		Sample standard deviation of x
1		$(x\sigma_{n-1})$ SHIFT $x\sigma_{n-1}$ EXE $(x\sigma_{n-1} = 3)$ Sample standard deviation of y
		$(y \sigma_{n-1}) \cdots \cdots \text{ SHFT} y \sigma_{n-1} $
		Constant term of regression formula
	Administratory of Princip	(A) $\cdots \cdots$ SHIFT A EXE (A = 7)
		Regression coefficient (B) SHIFT B EXE (B = 8)
		Correlation coefficient (r)
	***************************************	$ \qquad \qquad$
	-	Estimated value of $x(\hat{x})$
		y data SHIFT \oplus EXE (\oplus = \boxtimes)
		Estimated value of y (\hat{y}) $\dots x$ data SHIFT \hat{y} EXE ($\hat{y} = \hat{x}$)

Special func- tions	Ans function	The latest result obtained in manual or program computations is stored in memory. It is recalled by pressing Ans. * Mantissa of numeric value is 10 digits.
	Replay func- tion	 After computation results are obtained, the computation formula can be recalled by pressing either ⇔ or ⇔. If an error is generated, pressing either ⇔ or ⇔ will cancel the error and the point where the error was generated will be indicated by a blinking cursor.
	Multistatement function	Colons are used to join a series of statements or computation formulas. If joined using "", the computation result to that point is displayed.
	Memory ex- pansion	The Number of memories can be expanded from the standard 26. Memories can be expanded in units of one up to 820 (for a total of 846). Eight steps are required for one memory expansion. MODE In number of memories to be expanded EXE.

Graph func- tion tion		Graph range settings XmaxMaximum value of x XminMinimum value of x XsclScale of X-axis (space between points) YmaxMaximum value of y YminMinimum value of y YsclScale of Y-axis (space between points)
	Trace function	Moves pointer (blinking dot) on graph. $x-y$ coordinates can be read.
	Plot function	Marks pointer (blinking dot) at any coordinate on the graph display.
	Line function	Connects with a straight line two points created with plot function.
	Factor function	Magnifies or reduces a graph using pointer (blinking dot) as center.

Program computations

_		
Program input	Input mode	WRT mode (MODE 2)
	Computation mode	Mode that conforms with program specified by: MODE ⊞, MODE ⊞, MODE ⊠, MODE ⊠,
	Program area specification	Cursor is moved to the desired program area number (P0 through P9) using (and and), and (EXE is pressed.
Program ex- ecution	Execution mode	RUN mode (MODE 11)
	Program area specification	Execution starts with Prog program area No. EXE. Program area No.: 0~9
Program	Input mode	WRT mode (MODE 2)
editing	Program area specification	Cursor is moved to the desired program area number (P0 through P9) using 🖾 or 🖘, and EXE are pressed.
	Editing	Cursor is moved to position to be edited using (a), (b), (b) or (b). • Press correct key for corrections. • Press (b) for deletions. • Press (c) (c) to specify insert mode for insertion.
Program	Erase mode	PCL mode (MODE 3)
erasing	Erasing a program in a single program area	Cusor is moved to the desired program area number (P0 through P9) using and and and ac is pressed.
	Erasing the programs in all program areas	Press SHIFT McI (McI = DEL).

Program commands	Unconditional jump	Program execution jumps to the LbI n which corresponds to Goto n . * $n = 0$ through 9
	Conditional jumps	If conditional expression is true, the statement after "⇒" is executed. If not true, execution jumps to the statement following next "♣", ":" or "♣". True FRF⇒S Not true F: Formula R: Relational operator S: Statement * The relational operator is: =, ≠, >, <, ≥, ≤.
	Count jumps	The value in a memory is increased or decreased. If the value does not equal 0, the next statement is executed. If it is 0, a jump is performed to the statement following the next "+", ": " or " Increase
		When(V)=0 (S): Statement (V): Value in memory
	Subroutines	Program execution jumps from main routine to subroutine indicated by Prog n ($n = 0$ through 9). After execution of the subroutine, execution returns to the point following Prog n in the original program area.

File editor

File input	Filename in- put function	Specified by MODE ① (or ED" EXE and EDITOR" EXE). Filename up to 8 characters long (first character upper-case alphabetic character) follows quotation marks.
	Password	Passwords are up to 126 characters long. EXE enters file data input mode when password not assigned, and AC returns to filename input mode.
	File data input mode	Data can be entered up to 4,989 steps. Data items delimited by EXE.
File recall	Filename in- put function	Enter filename of file, along with password if required.
File edit	Filename in- put mode	Recall file and edit using DEL and ALPHA SHIFT INS.
Filename input mode	D command (Dump All File)	Displays filenames of all files created by file editor.
commands	F command (Free Bytes)	Displays number of steps remaining in file editor.
	DEL command (Delete File)	Deletes file specified by filename. Password entry also required if assigned.
	DELA com- mand (Delete All Except -*- File)	DELA EXE deletes all files not assigned passwords. DELA* EXE deletes all files, including those assigned passwords.
	E command (Editor End)	Cancels file editor mode to enter RUN mode (MODE II).
	n (positive integer)	Recalls file specified by n .
File data input mode commands	AC (Command Mode)	Pressed before entering any other file data input mode commands (\$ displayed).
	V command (Video Mode)	Returns cursor to its location immediately before AC was pressed.

File data input mode	T command (Top)	Moves cursor to beginning of file.
commands	B command (Bottom)	Moves cursor to end of file.
	n (integer) command (Move n-lines)	Moves cursor n lines (logical) from current position.
	S command (Search String)	Locates first data item containing specified search element.
	L command (Long Search)	Locates all data items containing specified search element.
	E command (File End)	Cancels file editor input mode and enters filename input mode.
	END com- mand (Editor End)	Cancels file data input mode and enters RUN mode (MODE 11).

Error messages

Manual/program computations

Message	Meaning	Countermeasure
Syn ERROR	①Computation formula contains an error. ②Formula in a program contains an error.	①Use ⑤ or ⑤ to display the point where the error was generated and correct it. ②Use ⑤ or ⑤ to display the point where the error was generated, press AC and then correct the program in the WRT mode.
Ma ERROR	①Computation result exceeds computation range. ②Computation is performed outside the input range of a function. ③Illogical operation (division by zero, etc.)	①②③ Check the input numeric value and correct it. When using memories, check that the numeric values stored in memories are correct.
Go ERROR	 ①No corresponding Lbl n to Goto n. ②No program stored in program area P n which corresponds to Prog n. 	 ①Correctly input a Lbl n to correspond to the Goto n, or delete the Goto n if not required. ②Store a program in program area P n to correspond to Prog n, or delete the Prog n if not required.
Ne ERROR	• Nesting of subroutines by Prog n exceeds 10 levels.	 Ensure that Prog n is not used to return from subroutines to main routine. If used, delete any unnecessary Prog n. Trace the subroutine jump destinations and ensure that no jumps are made back to the original program area. Ensure that returns are made correctly.

	······································	
Stk ERROR	Execution of computations that exceed the capacity of the stack for numeric values or stack for computations.	 Simplify the formulas to keep stacks within 8 levels for the numeric values and 20 levels for the computations. Divide the formula into two or more parts.
Mem ERROR	Attempt to use a memory such as Z[5] when no memory has been ex- panded.	 Expand memories using MODE (Defm). Use memories within the current number of memories.
Arg ERROR	Incorrect argument specification for a command that requires an argument.	 Correct the argument. Sci n, Fix n: n= natural number from 0 through 9. Goto n, Lbl n, Prog n: n = natural number from 0 through 9. Defm n: n = natural number between 0 to the number of remaining steps.

File editor

Message	Meaning	Countermeasure
Data Full !!	Attempt to create a new file when no more file steps remain.	Use DEL or DELA com- mand to delete unneeded files.
illegal command	Attempt to use an improper command.	Check command menu using Moss and enter correctly.
illegal name	Attempt to assign a file- name containing a space or without an upper-case alphabetic character in first position.	Use an upper-case alphabetic character in first position of filename.
cannot find	No corresponding data for a search element specified for S command or L command.	
did not pass	Entered password does not match registered password.	Enter proper password.
File not found	Attempt to print a file which does not exist under the specified filename, or to execute a subroutine file which does not exist.	Use D command to confirm filename.

Printer

Message	Meaning	Countermeasure
I/O ERROR	Improper connection between computer and FA-80.	Switch power OFF, disconnect units, reconnect units, switch power ON.
PRT ERROR	Error signal sent from printer because printer set to LOCAL when print command is sent from computer.	Set printer to ON LINE.

Cassette recorder

Message	Meaning	Countermeasure
Already exists	Attempt to load without clearing memory, or to load a file with a filename which already exists.	Perform memory all clear or delete the file with the same filename.
No contents	Attempt to save when no- thing exists in program area.	
Read ERROR	Tape stopped during LOAD or VERIFY, or defective tape being used.	Perform from beginning.
Area used	Attempt to load when program areas P0 through P9 already used. Attempt to load when no more file steps remain in the file editor.	Delete unneeded programs. Delete unneeded files.
too large size	Attempt to load program or file which exceeds remaining memory size.	Delete unneeded portions of program or file, or expand memory.
Verify ERROR	Attempt to verify with same attributes but different contents.	
type mismatch	Attempt to load with same filename but different attributes.	Check specified file attri- butes or tape counter.

LIST print

Message	Meaning	Countermeasure
cannot calculate	Attempt to perform statistical calculation without necessary data.	Check input data contents.
out of range	Value in memory exceeds allowable number of digits.	Check memory contents.

Input range of functions (general principles)

Function name	Input range
$\sin x$, $\cos x$, $\tan x$	$ x \le 9 \times 10^{\circ}$ degree
	$ x \leq 5 \times 10^7 \pi \text{rad}$
	$ x < 10^{10} \text{gra}$
$\sin^{-1}x$, $\cos^{-1}x$	$ x \leq 1$
$tan^{-1}x$	$ x < 10^{100}$
e^x	$-10^{100} < x \le 230.2585092$
$\sinh x$, $\cosh x$	$ x \le 230.2585092$
tanhx	$ x < 10^{100}$
$sinh^{-1}x$	$ x < 5 \times 10^{99}$
$\cosh^{-1}x$	$1 \leq x < 5 \times 10^{99}$
tanh ⁻¹ x	x < 1
$\log x$, $\ln x$	$0 < x < 10^{100}$
10 ^x	$-10^{100} < x < 100$
\sqrt{x}	$0 \le x < 10^{100}$
x^2	$ x < 10^{50}$
$x^{-1}(^1/x)$	$ x < 10^{100}, x \neq 0$
$\sqrt[3]{x}$	$ x < 10^{100}$
x!	$0 \le x \le 69$ (x is an integer.)
x^y	$x > 0: -1 \times 10^{100} < y \cdot \log x < 100 x = 0: y > 0$
	x < 0: $y = n$, $1/2 + 1$ (n : integer)
$\sqrt[y]{x}(x^{1/y})$	$x > 0$: $y \neq 0$, $-1 \times 10^{100} < 1/y \cdot \log x < 100$
	$x=0: y>0$ $x<0: y=2n+1, 1/n (n \neq 0)$
	However, $-1 \times 10^{100} < 1/y \cdot \log x < 100$
Pol (x, y)	$ x < 10^{100}, y < 10^{100}$ However, $\sqrt{x^2 + y^2} < 10^{100}$
$\operatorname{Rec}(r, \theta)$	$ r < 10^{100}$, $ \theta \le 9 \times 10^9$ degree
, . , . , . ,	$ \theta \le 5 \times 10^7 \pi \text{ rad}$
	θ <10 ¹⁰ gra
<u> </u>	4

Binary number	(Positive) 111111111111111 $\ge x \ge 0$
-	(Negative) 1111111111111111 $\ge x \ge$
	100000000000000
Octal number	(Positive) $1777777777777777777777777777777777777$
	(Negative) $37777777777777777772 \ge x \ge 20000000000000000000000000000000$
Hexadecimal	(Positive) 7 FFFFFFF $\geq x \geq 0$
number	(Negative) FFFFFFF $\geq x \geq 80000000$
Decimal→	$ x \le 9999999$. 999. If degrees, minutes and
sexagesimal	seconds exceed a total of 11 digits, the higher
	(degrees, minutes) values will be given priority,
	and displayed in 11 digits.
Statistical com-	$ x < 10^{50}, y < 10^{50}, n < 10^{100}$
putation	

- * As a rule, the accuracy of a result is ± 1 at the 10th digit.
- * Errors may be cumulative with such internal continuous computations with the functions, x^y , $x^{1/y}$, x!, $\sqrt[q]{x}$, and accuracy is sometimes affected.
- * In $\tan x$, $|x| \neq 90^{\circ} \times (2n+1)$, $|x| \neq \pi/2 \text{rad} \times (2n+1)$, $|x| \neq 100 \text{ gra } (2n+1)$, (*n* is an integer.)
- * With $\sinh x$ and $\tanh x$, when x=0, errors are cumulative and accuracy is affected.

SPECIFICATIONS

Model: fx-8500G

Basic computation functions:

Negative numbers, exponents, parenthetical addition/subtraction/multiplication/division(with priority sequence judgement function—true algebraic logic).

Built-in functions:

Trigonometric/inverse trigonometric functions (units of angular measurement: degrees, radians, grads), hyperbolic/inverse hyperbolic functions, logarithmic/exponential functions, reciprocals, factorials, square roots, cube roots, powers, roots, squares, decimal-sexagesimal conversions, binary-octal-hexadecimal conversions/computations, coordinate transformations, π , random numbers, absolute values, integers, fractions.

Statistical computation functions:

Standard deviation—number of data, sum, sum of squares, mean, standard deviation (two types). Linear regression—number of data, sum of x, sum of y, sum of squares of y, sum of squares of y, standard deviation of x (two types), standard deviation of y (two types), constant term, regression coefficient, correlation coefficient, estimated value of x, estimated value of y.

Memories:

26 standard (846 maximum)

Computation range:

 \pm 1×10⁻⁹⁹~ \pm 9.99999999×10⁹⁹ and 0. Internal operation uses 13-digit mantissa.

Rounding:

Performed according to the specified number of significant digits or the number of specified de-

cimal places.

Programs

Number of steps: 6,566 maximum

Jump function: Unconditional jump (Goto), 10 maximum

Conditional jump $(=, \neq, >, <, \geq, \leq)$

Count jumps (Isz, Dsz)

Subroutines: 9 levels

Number of stored

10 maximum (P0 to P9)

programs:

Program checking, debugging, deletion, addi-

tion, etc.

Graph function

Check function:

Built-in function (20 types) sin, cos, tan, sin⁻¹, cos⁻¹, tan⁻¹, sinh, cosh, tanh, sinh⁻¹, cosh⁻¹, tanh⁻¹, log, ln, 10°, e^{*},

 x^2 , $\sqrt{}$, $\sqrt[3]{}$, x^{-1}

Graph commands: Graph, Range, Plot, Trace, Factor, Line, X→Y

Graphs: User generated functions, statistical graphs (bar

graphs, line graphs, normal distribution curves,

regression lines), instant factor.

File editor function

Number of steps: 4,989 maximum

Filenames: 8 cha Passwords: 126 c

8 characters maximum per file 126 characters maximum per file

Commands: (Filename input mode)

D, F, DEL, DELA, DELA*, E, n

⟨File data input mode⟩
V, T, B, n, S, L, E, END

Common section

Power supply: Three lithium batteries (CR2032)

Power consump-

0.03W

tion:

Battery life: Approximately 100 hours on type CR2032.

Auto power off:

Power is automatically switched off approx-

imately 6 minutes after last operation.

Ambient tempera-

0°C-40°C(32°F-104°F)

ture range: Dimensions:

17.6mmH × 84mmW × 180mmD

(1/4"H×31/4"W×7"D)

Weight:

190g (6.7oz) including batteries

GUIDELINES LAID DOWN BY FCC RULES FOR USE OF THE UNIT IN THE U.S.A. (not applicable to other areas).

WARNING: This equipment generates and uses radio frequency energy and if not installed and used properly, that is, in strict accordance with the manufacturer's instructions, may cause interference to radio and television reception. It has been type tested and found to comply with the limits for a Class B computing device in accordance with the specifications in Subpart J of Part 15 of FCC Rules, which are designed to provide reasonable protection against such interference in a residential installation. However, there is no guarantee that interference will not occur in a particular installation. If this equipment does cause interference to radio or television reception, which can be determined by turning the equipment off and on, the user is encouraged to try to correct the interference by one or more of the following measures:

- reorient the receiving antenna
- relocate the computer with respect to the receiver
- move the computer away from the receiver
- plug the computer into a different outlet so that computer and receiver are on different branch circuits.

If necessary, the user should consult the dealer or an experienced radio/television technician for additional suggestions. The user may find the following booklet prepared by the Federal Communications Commission helpful:

"How to Identify and Resolve Radio-TV Interference Problems" This booklet is available from the US Government Printing Office, Washington D.C., 20402, Stock No.004-000-00345-4.
