OWNER'S MANUAL

CASIO.

- The information contained herein is subject to change without notice.
- Reproduction of this manual either in part or its entirety is forbidden.
- Note that the manufacturer assumes no responsibility for any injury or loss incurred while using this manual.
- Due to limitations imposed by printing processes, the displays shown in this manual are only approximations and may differ somewhat from actual displays.

FOREWORD

Thank you for your purchase of the CASIO fx-6000G/fx-6500G. This unit is a totally new type of advanced programmable computer. Besides 82 (fx-6500G)/76 (fx-6000G) scientific functions, graph functions also make it possible to produce a wide variety of useful graphs. Manual computations can be easily performed following written formulas (true algebraic logic). A replay function is provided that allows confirmation or correction when key operation errors occur. Programs can also be input by following true algebraic logic, so repeat and/or complex computations are simplified.

This manual is composed of four sections:

- 1. Configuration and Operation
- 2. Manual Computations
- 3. Graphs
- 4. Program Computations

Section 1 should be read first to become familiar with the nomenclature, handling and cautions concerning this unit. Sections 2, 3 and 4 can then be read in order to master each type of functions through samples and explanations.

HANDLING PRECAUTIONS

- This unit is composed of precision electronic components and should never be disassembled. Do not drop it or otherwise subject it to sudden impacts or sudden temperature changes. Be especially careful to avoid storing the unit or leaving it in areas exposed to high temperature, humidity or large amounts of dust. When exposed to low temperatures, the unit will require more time to display answers and may even fail to operate. The display will return to normal once normal temperature is attained.
- Batteries should be replaced every 2 years even if the unit is not used for extended periods. Never leave dead batteries in the battery compartment. They can leak and cause damage to the unit.
- Avoid using volatile liquids such as thinner or benzine to clean the unit.
 Wipe the unit with a soft, dry cloth or a cloth that has been dipped in a neutral detergent solution and wrung out.
- If malfunction of the unit should occur, either bring or send the unit to your retailer or the nearest CASIO dealer.
 Be sure to clearly explain the problem in detail.
- Before assuming malfunction of the unit, be sure to carefully reread this manual and ensure that the problem is not due to insufficient battery power, programming or operational errors.

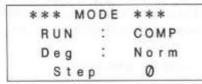

1-1 NOMENCLATURE AND FUNCTIONS

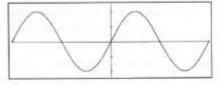

- 1) Power switch
- ② Shift key
- ③ Numeric keys
- Arithmetic operation keys
- ⑤ Execute key
- ⑤ Function keys
- ② Answer key

- ® Delete key
- All clear key
- @ Graph keys
- ① Cursor/Replay keys
- 10 Mode key
- Display window

Display window

The display window is capable of displaying 16-character by 4-line text and symbols. Graphs are produced on a 95 by 32-dot matrix. A system display as shown on the left indicates the following: the system mode calculation mode, angle unit, number of decimal places or number of significant digits and key input buffer status.

The display on the right shows a sine graph as a representative example of the graphs.

The letter "O" is distinguished from zero by adding a slash for the zero (0).

Power switch

Power is turned ON by sliding the power switch up. Sliding the power switch down turns power OFF.

Special operation keys

SHIFT Shift key

Press when using the function commands and functions marked in brown on the key panel. An S will blink on the display to indicate that shift has been pressed. Pressing shift again will cause the S to disappear from the display and the unit to return to the status it was in before shift was originally pressed.

MODE Mode Key

Press when setting the status of the unit or the unit of angular measurement.

- MODE 0 ... Press while a graph is displayed to reduce the vertical (y-axis) pitch by half and redisplay graph. At this time the ratio between the x-axis pitch and y-axis pitch will be 2:1. Pressing again while the half pitch y-axis graph is displayed returns to the original graph.
- MODE II ... For manual computations and program execution.

MODE 2 ... For writing or checking programs.

MODE 3 ... For clearing programs.

MODE 4 ... Deg displayed. If EXE is pressed, unit of angular measurement is specified as degress.

MODE 5 ... Rad displayed. If EXE is pressed, unit of angular measurement is specified as radians.

MODE 6 ... Gra displayed. If EXE is pressed, unit of angular measurement is specified as grads.

will specify the number of decimal places according to the value entered.

Ex. MODE 7 3 EXE → Three decimal places

Sci displayed. Entering a value from 0 to 9 followed by EXE
will specify the number of significant digits from 1 to 10.

Ex. MODE 8 5 EXE → 5 significant digits

MODE 9 ... Norm displayed. Pressing EXE will cancel the specified number of decimal places or the specified number of significant digits.

MODE ... Defm displayed. Entering a value followed by EXE will specify the number of memories available.

Ex. MODE : ☐ ☐ EXE → Number of memories available increased by 10.

If EXE is pressed without entering a value, the current number of memories available and remaining steps will be displayed. (See page 24.)

Ex. MODE . EXE

Defm
Program : 56
Memory : 36
350 Bytes Free

MODE : ... Specifies COMP mode for arithmetic computation or function computation (program execution possible).

(Base-n mode).

MODE [X.	. For	standard	deviation	computations	(SD1	mode)
--------	----	-------	----------	-----------	--------------	------	-------

MODE ... For regression computations (LR1 mode).

- SHIFT MODE ... For production of a bar graph, line graph or normal distribution curve according to single variable statistical data (SD2 mode).
- SHIFT MODE : ... For production of a regression line according to paired variable statistical data (LR2 mode).
- MODE 4 ... Pressed after a numeric value representing degrees is input.
- SHET MODE 5 ... Pressed after a numeric value representing radians is input.
- MODE 6 ... Pressed after a numeric value representing grads is input.

ALPHA Alphabet key

Press to input alphabetic characters or special characters. Pressing ALPHA displays and allows the input of only one character. After that, the unit returns to the status it was in before the ALPHA key was originally pressed. Pressing SHET followed by ALPHA will lock the unit in this mode and allow consecutive input of alphabetic characters until ALPHA is pressed again.

K m µ n p f

- 44

A	В	C	D	E	F
G	н	1	J	K	L
М	N				
1 0	10	10 100	0	e	T

U V W X Y

Program/Goto key

Press Prog., enter a value from 0 to 9 and then press EXE to execute a program.

Ex. Prog 1 EXE → Execution of Program 1 begins.

Pressing [SIFT] followed by [Goto] (Prog] key) will cause Goto to appear on the display. This is a jump command used in programs.

tine x-y Cursor/Replay keys

Press to move the cursor (blinking "_") left, right, up, and down on the display. The key moves the cursor to the left, moves the cursor to the right, moves the cursor up, and moves the cursor down. Holding any of the keys down will cause the cursor to continuously move in the respective direction.

Once a formula or numeric value is input and <code>EXE</code> is pressed, the executed key and key become "replay" keys. In this case, pressing displays the formula or numeric value from the beginning, while pressing displays it from the end. This allows the formula to be executed again by changing the values.

Pressing of \bigcirc or \bigcirc while the ratio between the pitches of the x/y axes for a displayed graph are 1:1 (by operation of \bigcirc) shifts the display to show the x-y intersection centered on the screen, the portion of the graph above the y-axis, or the portion of the graph below the y-axis.

Pressing the cursor key following ster changes their functions to those marked above the keys.

Lbi () is used to input labels within programs.

ins () inserts a space at the current position of the cursor. Line in makes it possible to produce line graphs or regression lines. The x-y () key makes it possible to switch the X and Y coordinate display during graph trace operations.

and following the MODE key are used for contrast adjustments.

DEL Delete key

Press to delete the character at the current position of the cursor. When the character is deleted, everything to the right of the cursor position will shift one space to the left.

Pressing SHET DEL EXE will clear the memory contents.

AC All clear key

Press to completely clear the displayed formulas, numeric values or texts, and to clear all of the input buffer contents. Also used to release errors indicated by error message displays, and to restore power after reactivation of the auto power off function. (See page 27.)

EXE Execute key

Press to obtain the result of a computation or to draw a graph. Pressed after data input for a programmed computation or to advance to the next execution after a computation result is obtained.

Ans Answer key

Pressing Ans followed by EXE will recall the last computation result. It can be recalled by Ans EXE even after it has been cleared using the AC key or by switching the power of the unit OFF. When used during program execution, the last result computed is recalled.

■ ① ~ ⑨, ⊙, EXP Numeric/Decimal point/Exponent input keys

When entering numeric values, enter the number in order. Press the \boxdot key to enter the decimal point in the desired position.

To input 1.23×106, press 1 23 EXP (-) 6.

SHIFT key combinations for the various modes are as follows:

COMP mode (MODE H)	Base-n mode (MODE)
- +	+
Isz ≥ ≤	ISZ ≥ ≤
Dsz > <	D82 > <
Rnd Rans n	
	Pol(Rec(Rnd Ran# a

SD mode (MODE ⋈)	LR mode (MODE +)
- +	A B r
Isz 🖹 🖹	g g σ κ g t n - 1
P 200 2001	x x x x x x x x x x x x x x x x x x x
processor processor processor	processing processing processing

Standard deviation functions can be used.

Ran # #

Paired variable statistic functions can be used.

cannot be used in this mode.

Ran# #

Computation keys

⊞ ⊠ ⊞ Arithmetic operation keys

For addition, subtraction, multiplication and division, enter the computation as it reads. SHET key combinations for the various modes are as follows:

COMP mode or SD mode

Foll Rec (+ and - keys) ... Coordinate transformation

LR mode

Foll Rect ... Coordinate transformation

Graph keys

Used to produce a variety of graphs (see page 57 for details). These keys cannot be used in the Base-n mode.

Mode display/Plot key

- Used to confirm the status of the system mode, calculation mode, angle unit and rounding. Setting status is displayed only while this key is pressed.
- Pressed following step to plot a point on the graph screen.

Graph Graph/Trace key

- Pressed before entering a formula to be used for a graph ("Graph Y=" appears on the display).
- Pressed following shift to trace over an existing graph and display the x or y coordinate value.

Range Range/Factor key

- Used to confirm or set the range and size of graphs.
- Pressed following ster to magnify or reduce the upper and lower ranges of graphs.

G--T Graph-text/Clear screen key

- Switches between the graph display and text display (see page 20).
- SHIFT CIN EXE clears the graph display. The text display cannot be cleared using this operation.

Function keys

Press for functional computation. Various uses are available in combination with the [9117] key, and/or depending on the mode being used.

Multistatement/Display key

 Press to separate formulas or commands in programmed computations or consecutive computations.

The result of such combinations is known as a multistatement. (See page 38.)

• When pressed following the series key, the results of each section of the programmed computations or consecutive computations are sequentially displayed with each press of EXE.

Engineering/Negation key

Press to convert a computation result to an exponential display whose exponent is a multiple of three.

$$(10^3 = \overset{\text{kilo}}{\text{K}}, 10^6 = \overset{\text{mega}}{\text{M}}, 10^9 = \overset{\text{piga}}{\text{G}}, 10^{-3} = \overset{\text{milo}}{\text{m}}, 10^{-6} = \overset{\text{micro}}{\mu}, 10^{-9} = \overset{\text{nano}}{\text{n}}, 10^{-12} = \overset{\text{pico}}{\text{p}})$$

- When obtaining logical negation for a value in the Base-n mode, press prior to entering the value.
- Press following the SHIFT key in the Base-n mode to obtain the exclusive logical sum.

Root/Integer key

- Press prior to entering a numeric value to obtain the square root of that value.
- When pressed following the SHFT key, the integer portion of a value can be obtained.
- Press followed by EXE in the Base-n mode to specify the decimal computation mode.
- When pressed following the SHIFT key in the Base-n mode, the subsequently entered value is specified as a decimal value.

x¹ Square/Fraction key

- Press after a numeric value is entered to obtain the square of that value.
- When pressed following the SHFT key, the decimal portion of a value can be obtained.
- Press followed by EXE in the Base-n mode to specify the hexadecimal computation mode.
- When pressed following the SHFT key in the Base-n mode, the subsequently entered value is specified as a hexadecimal value.

Gog Common logarithm/Antilogarithm key

- Press prior to entering a value to obtain the common logarithm of that value.
- When pressed following the suff key, the subsequently entered value becomes an exponent of 10.
- Press followed by EXE in the Base-n mode to specify the binary computation mode.
- When pressed following the SHFT key in the Base-n mode, the subsequently entered value is specified as a binary value.

in Natural logarithm/Anti-natural logarithm key

- Press prior to entering a value to obtain the natural logarithm of that value.
- When pressed following the SHFT key, the subsequently entered value becomes an exponent of e.
- Press followed by EXE in the Base-n mode to specify the octal computation mode.
- When pressed following the sept key in the Base-n mode, the subsequently entered value is specified as an octal value.

Reciprocal/Factorial key (fx-6500G)

- Press after entering a value to obtain the reciprocal of that value.
- When pressed following the series key, the factorial of a previously entered value can be obtained.
- Press in the Base-n mode to enter A (10₁₀) of a hexadecimal value.
- Degree/minute/second key (decimal → sexagesimal key) (fx-6500G)
 - Press to enter sexagesimal value. (degree/minute/second or hour/ minute/second)

Ex. 78°45'12"→78 ···· 45 ··· 12 ···

- When pressed following the ser key, a decimal based value can be displayed in degrees/minutes/seconds (hours/minutes/seconds).
- Press in the Base-n mode to enter B (11₁₀) of a hexadecimal value.

Hyperbolic key (fx-6500G)

- Pressing hyp, and then sin, cos, or tan prior to entering a value produces the respective hyperbolic function (sinh, cosh, tanh) for the value.
- Pressing SHIFT, then Typ and then Sin, Cos, or tan prior to entering a
 value produces the respective inverse hyperbolic function (sinh-1,
 cosh-1, tanh-1) for the value.
- Press in the Base-n mode to enter C (12₁₀) of a hexadecimal value.

Reciprocal key (fx-6000G)

- * Press after entering a value to obtain the reciprocal of that value.
- Press in the Base-n mode to enter A (10₁₀) of a hexadecimal value.
- x/ Factorial key (fx-6000G)
 - Press after entering a value to obtain the factorial of that value.
 - Press in the Base-n mode to enter B (11₁₀) of a hexadecimal value.
- Degree/minute/second key (decimal --- sexage simal key) (fx-6000G)
 Press to enter sexage simal value.

(degree/minute/second or hour/minute/second)

Ex. 78*45'12" → 78 45 12

- When pressed following the series key, a decimal based value can be displayed in degrees/minutes/seconds (hours/minutes/seconds).
- Press in the Base-n mode to enter C (1210) of a hexadecimal value.

- Trigonometric function/Inverse trigonometric function keys
 - Press one of these keys prior to entering a value to obtain the respective trigonometric function for the value.
 - Press shift and then one of these keys prior to entering a value to obtain the respective inverse trigonometric function for the value.
 - Press in the Base-n mode to enter D, E, F (13₁₀, 14₁₀, 15₁₀) of a hexadecimal value.
- (-) Minus key
 - Press prior to entering a numeric value to make that value negative.
 Ex. —123→ (→) [1] [2] [3]
 - When pressed following the same numeric value can be assigned to multiple memories.
 - Ex. To assign the value 456 to memories A through F: 4 5 6 -
 - Press in the Base-n mode prior to entering a value to obtain the negative of that value. The negative number is the two's complement of the value entered.
- Assignment key
 - Press prior to entering a memory to assign the result of a computation to that memory.
 - Ex. To assign the result of 12+45 to memory A: 1 2 + 4 5 ALPHA EXE
 - During execution of program computations or consecutive computations, press following the SHIFT key to enter a numeric value.
- Parenthesis keys
 - Press the open parenthesis key and the closed parenthesis key at the position required in a formula.
 - When pressed following the self key, a comma or semicolon can be inserted to separate the arguments in coordinate transformation or consecutive computations.
- Power/Absolute value key
 - Enter x (any number), press this key and then enter y (any number) to compute x to the power of y.
 - In the SD or LR mode, this function is only available after pressing the SHFT key.
 - Press following the ser key to obtain the absolute value of a subsequently entered numeric value.
 - Press in the Base-n mode to obtain a logical product ("and").
 - Press in the SD or LR mode to delete input data.

Root/Cube root key

- Enter x, press this key and then enter y to compute the xth root of y. In the SD or LR mode, this function is only available after pressing the str.
- Press following the SHIFT key to obtain the cube root of a subsequently entered numeric value.
- Press in the Base-n mode to obtain a logical sum ("or").
- Used as a data input key in the SD or LR mode.

Contrast adjustment

Pressing the or key following the key adjusts the contrast of the display. Pressing makes the screen lighter, while makes it darker. Holding either key down will cause the display to successively become respectively lighter or darker.

Pressing any other key besides MODE, 🖘, or 🖘 (as well as 😰, 📳) cancels contrast adjustment.

 Light display contrast even at the darkest setting indicates that battery power is too low. In this case, replace batteries as soon as possible.

* Contrast adjustment is impossible during range display using the Range key. (See page 62.)

1-2 POWER AND BATTERY REPLACEMENT

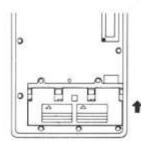

Power is supplied to this unit by three lithium batteries (CR2032C). If the power of the batteries should diminish, the display will weaken and become difficult to read. A weak display even after contrast adjustment (see page 12) may indicate power is too low, so the batteries should be replaced. When making replacements, be sure to replace all three batteries.

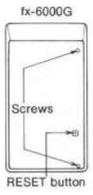

- * If batteries are used for longer than two years, there is the danger of leakage. Be sure to replace batteries at least once every two years even if the unit is not used during that period.
- * Stored programs or data are erased when batteries are replaced. Therefore, it is recommended that programs and data required for later use be recorded on a coding sheet before replacing batteries.
- * Be sure to use batteries specified by Casio.

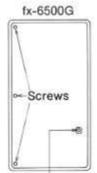

Procedure

- Slide the power switch to the OFF position, remove the two (or three) screws on the back of the unit with a screwdriver, and remove the back cover.
- ② Slide the battery pressure plate in the direction indicated by the arrows and remove it.
- 3 Remove the three old batteries from the unit.

(This can be done easily by turning the unit so the battery compartment is facing downwards, and then lightly tapping the unit.)

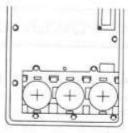

RESET button

Wipe the surfaces of three new batteries with a soft, dry cloth and load them into the unit ensuring that the positive

sides are facing upwards.

⑤ Fasten the battery pressure plate in place, and replace the back cover.

* IMPORTANT: Never dispose of old batteries in such a way that they will be incinerated. Batteries may explode if exposed to fire.

CAUTIONS:

If the batteries being replaced are not totally without power, it is possible to replace batteries so quickly that previously stored programs and memory contents are not erased or altered. In this case, however, all programs and memory contents should be carefully checked after battery replacement.

If battery power should be allowed to decrease or if batteries are removed from the unit for extended periods, programs and memory contents may be erased or altered. In this case, the RESET button located on the back of the unit should be pressed using a pointed object with the power ON after batteries are replaced.

All memory contents and programs will be erased and the display contrast will automatically be set to its median setting. Readjust contrast to the setting which makes the display easy to read.

* If the display does not light up or the unit does not work normally even after pressing the RESET button, remove the batteries and leave them out for a few minutes. Then install them again and press the RESET button.

Keep batteries out of the reach of small children. If a battery should inadvertently be swallowed, contact a doctor immediately.

1-3 BEFORE BEGINNING COMPUTATIONS...

Computation priority sequence

This unit employs true algebraic logic to compute the parts of a formula in the following order:

- 1. Coordinate transformation Pol (x, y), Rec (r, θ)
- 2. Type A functions* x2, x-1, x1, *, *, *, *, *.
- 3. Power/root x*. √
- 4. Abbreviated multiplication format in front of π or memory 2π , 4R, etc.
- Type B functions* √ , √ , log, 10^x, ln, e^x, sin, cos, tan, sin⁻¹, cos⁻¹, tan⁻¹, sinh, cosh, tanh, sinh⁻¹, cosh⁻¹, tanh⁻¹, (—), Abs, Int, Frac, h, d, b, o, Neg, Not
- Abbreviated multiplication format in front of Type B functions or parenthesis 3sin5, 6√7, 2sin30cos60, etc.
- 7. X. ÷
- 8. +, -
- 9. and
- 10. or, xor
- 11. Relational operators <, >, =, ≠, ≤, ≥
- * Functions are divided into two types.

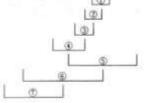

Type A functions are entered after the argument, while Type B functions are entered before the argument.

- * When functions with the same priority are used in series, execution is performed from right to left: e.g., e'ln√120 → e' |ln√120| .
 Otherwise, execution is from left to right.
- * Compound functions are executed from right to left:

e.g., sin cos⁻¹0.6 → sin (cos⁻¹0.6).

* Everything contained within parentheses receives highest priority.

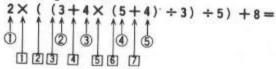

Ex. 2+3× (log sin2 π^2_{rad} +6. 8) =22. 07101691

Number of stacks

This unit features a memory known as a stack for the temporary storage of low priority numeric values and commands (functions, etc). The numeric value stack has eight levels, while the command stack has twenty. If a complex formula is employed that exceeds the stack space available, a stack error (Stk ERROR) message will appear on the display.

Ex. Stack counting method

value stack		sta	ack
1	2	1	×
2	3	[2]	(
3	4	[3]	(
4	5	4	+
5	4	[5]	×
:		6	(
		7	+
		:	

Computations are performed in the order of the highest computation priority first. Once a computation is executed, it is cleared from the stack.

Computation modes

This unit features modes for manual computations, storing programs, and modes for general as well as statistical computations. The proper mode to suit computational requirements should be employed.

Operation modes

There are a total of three operation modes.

1. RUN mode

Graph production as well as manual computations and program executions.

2. WRT mode

Program storage and editing. (See Section 4.)

PCL mode
 Deletion of stored programs. (See Section 4.)

Computation modes

There are a total of six computation modes which are employed according to the type of computation.

1. COMP mode

General computations, including functional computations.

2. Base-n mode

Binary, octal, decimal, hexadecimal conversion and computations, as well as logical operations. (See page 46.) Function computations and graph drawing cannot be performed.

3. SD1 mode

Standard deviation computation (single variable statistics). (See page 50.)

4. SD2 mode

For production of bar graph, line graph or normal distribution curve according to single variable statistical data. (See page 80.)

5. LR1 mode

Regression computation (paired variable statistics). (See page 52.)

6. LR2 mode

For production of regression line graph according to paired variable statistical data. (See page 84.)

With so many modes available, computations should always be performed after confirming which mode is active.

* IMPORTANT: When the power of the unit is switched OFF (including auto power off), the current system mode is cancelled, and the unit will be set to the RUN mode when switched ON again. However, the calculation mode, number of decimal place setting (MODE) 7 n), number of significant digits

(MODE ® n), and angle unit (Deg, Rad, Gra) will be retained in memory. The status of the currently specified mode will be shown on the display when power is switched ON

Confirm whether the desired mode is set before performing calculations.

	*** MODE	***	Coloulation
System mode — (RUN, WRT, PCL)	PCL) RUN : COMP	Calculation mode (COMP, Base-n, SD1, SD2, LR1, LR2)	
Angle unit — (Deg, Rad, Gra)	—>Deg :	Norm-	Number of digits (Fix.
	Step	0	Sci, Norm)

Number of input/output digits and computation digits

• The allowable input/output range (number of digits) of this unit is 10 digits for a mantissa and 2 digits for an exponent. Computations, however, are internally performed with a range of 13 digits for a mantissa and 2 digits for an exponent.

Ex. 3×10°÷7=

3 EXP	5 🕀	7 EXE

42857.14286
0.14285714

 Computation results greater than 10¹⁰ (10 billion) or less than 10¹² (0.01) are automatically displayed in exponential form.

Ex. 123456789×9638=

123456789 × 9638 EXE

1	189876	532 : +12
	1	1
	Mantissa	Exponent

Once a computation is completed, the mantissa is rounded off to 10 digits and displayed. And the displayed mantissa can be used for the next computation.

Ex. 3×10°÷7=

3 EXP	5 🖪	7	ÉXE
∃ 428	357	EXE	

42857.14286
0.14286

^{*} Values are stored in memory with 13 digits for the mantissa and 2 digits for the exponent.

Overflow and errors

If the computational range of the unit is exceeded, or incorrect inputs are made, an error message will appear on the display window and subsequent operation will be impossible. This is the error check function. The following operations will result in errors:

The answer, whether intermediate or final, or any value in memory exceeds the value of ±9.99999999×10st.

(2) An attempt is made to perform functional computations that exceed the input range. (See page 193.)

Improper operation during statistical computations.
 (Ex. Attempting to obtain x or xσn without data input.)

(4) The capacity of the numeric value stack or the command stack is exceeded.

(Ex. Entering nineteen successive ☐ 's followed by ② ⊕ ③ ☒ ④)

(5) Even though memory has not been expanded, a memory name such as Z [2] is used. (See page 24 for details on memory.)

(6) Input errors are made. (Ex. 5 + ± 3 ExE)

(7) When improper arguments are used in commands or functions that require arguments. (i.e. Input of an argument outside of the range of 0~9 for Sci or Fix.)

The following error messages will be displayed for the operations noted above:

(I)~(3) Ma ERROR

(4) Stk ERROR

(5) Mem ERROR

(6) Syn ERROR

(7) Arg ERROR

Besides these, there are an "Ne ERROR" (nesting error) and a "Go ERROR". These errors mainly occur when using programs. See page 99 or the Error Message Table on page 191.

Number of input characters

This unit features a 127-step area for computation execution.

One function comprises one step. Each press of numeric or \boxplus , \boxminus , \boxtimes and \boxminus keys comprise one step. Though such operations as and the last term of the two key operations, they actually comprise only one function and, therefore, only one step.

These steps can be confirmed using the cursor. With each press of the 🖾 or key the cursor is moved one step.

Input characters are limited to 127-steps. Usually the cursor is represented by a blinking "_", but once the 122nd step is reached the cursor changes to a blinking "■". If the "■" appears during a computation, the computation should be divided at some point and performed in two parts.

* When numeric values or computation commands are input, they appear on the display window from the left. Computational results, however, are displayed from the right.

Graphic and text displays

This unit has a graph display for production of graphs, as well as a text display for production of formulas and commands. These two types of display contents are stored independently of each other.

Switching between graph and text displays is performed using the a-r key. Each press of G+T switches from the current type of display to the other. Operations to clear the display depend upon the type of display being shown:

Graphs: SHFT CIS EXE

Text Ac

Pressing the AC key causes a cleared text display to appear if pressed during a graph display.

Display registers

This unit has separate registers for storing text and graph displays. Both of these two registers are unaffected by key operations except for those related to their functions (calculations or AC key operation during text display; graph drawing, switching to text display by G-T after clearing graph display by SHFT CIS EXE).

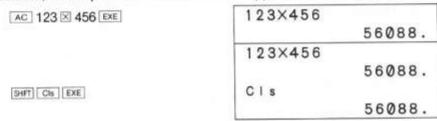

Since the register stores the previous calculation results, they can be recalled. This is especially useful in the text mode for binary, octal, decimal, and hexadecimal conversions, as well as decimal and significant digit settings.

The following commands will produce previous calculation results:

• Lbl 〇	• Deg	 Prog ○
• Dsz 🔾	• Rad	100
• Isz 🔾	• Gra	
• McI	• Fix (
• Hex	• Sci 🔾	
• Dec	 Norm 	
• Bin	• Rnd	
Oct	• Scl	

Ex. Perform the calculation 123×456, and then clear the graph display.

* The SHIFT CIS EXE operation during graph display does not affect the calculation, so the previous calculation result appears on the display.

A calculation result displayed as shown here is cleared to 0 by pressing AC, or if the power of the unit is switched OFF (including auto power off).

200	0			
	Cor	rect	10	ทร

- To make corrections in a formula that is being input, use the ⊕ and less keys to move to the position of the error and press the correct keys.
- Ex. To change an input of 122 to 123:

122_	
122	
123_	

Ex. To change an input of cos60 to sin60:

cos	60	
43	40	фı
sin		

С	0	s	60_	
C	0	S	60	
s	1	n	60	

- * If, after making corrections, input of the formula is complete, the answer can be obtained by pressing EXE. If, however, more is to be added to the formula, advance the cursor using the Exelution key to the end of the formula for input.
- olf an unnecessary character has been included in a formula, use the and keys to move to the position of the error and press the DEL key. Each press of DEL will delete one command (one step).
 - Ex. To correct an input of 369××2 to 369×2:

369XX2

369××2_	
369× <u>2</u>	

- If a character has been omitted from a formula, use the and keys to move to the position where the character should have been input, and press followed by the key. Press the last and insertions can be subsequently performed as desired.
 - Ex. To correct an input of 2.362 to sin2.362:

2.362_	
2.362	
2.362	
sin [2].36 ²	

"When set instance pressed, the letter at the insertion position is surrounded by "[]" and blinks. As many letters and/or commands as desired can be inserted at this position until [], [], [], [], or [AC] is pressed. This blinking [] is indicated by "[]" in the alphabet mode ([ALPHA] key), while it is indicated by "[]" in the shift mode ([SHF]).

Memory

This unit contains 26 standard memories. Memory names are composed of the 26 letters of the alphabet. Numeric values with 13 digits for a mantissa and 2 digits for an exponent can be stored.

Ex. To store 123.45 in memory A:

123.45→A_	
	123.45

Values are assigned to a memory using the key followed by the memory name.

Ex. To store the sum of memory A+78.9 in memory B:

A + 78.9→B_	
	202.35

Ex. To add 74.12 to memory B:

ALPHA	B # 7	74.12	-	ALPHA	В
EXE					

B+74.12	→B
	276.47

To check the contents of a memory, press the name of the memory to be checked followed by EXE.

To clear the contents of a memory (make them 0), proceed as follows:

Ex. To clear the contents of memory A only:

0	 ALPHA	13	EXE
1000	 d Section 19	-	the state of the

Ex. To clear the contents of all the memories:

SHFT McI

McI_	
	0.

- To store the same numeric value to multiple memories, press 町 followed by (☐ key).
 - Ex. To store a value of 10 in memories A through J:

10 → ALPHA M SHFT ~ ALPHA J	1 0→A~J_	
EXE	10.	

Memory expansion

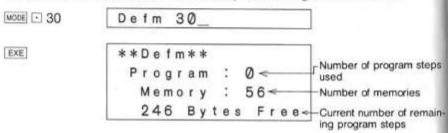

Though there are 26 standard memories, they can be expanded by changing program storage steps to memory. Memory expansion is performed by converting 8 steps to one memory.

* See page 102 for information on the number of program steps.

Number of memories	26	27	28	***	36	***	76	999	86
Number of steps	486	478	470	***	402		86	***	6

Memory is expanded in units of one. A maximum of 60 memories can be added for a maximum total of 86 (26 \pm 60). Expansion is performed by pressing $\frac{\text{MODE}}{\text{C}}$, followed by \Box , a value representing the size of the expansion, and then $\boxed{\text{EXE}}$.

Ex. To expand the number of memories by 30 to bring the total to 56:

The number of steps used, number of memories and number of remaining steps are displayed. The number of remaining steps indicates the current unused area, and will differ according to the size of the program stored. To check the current number of memories, press [MODE], followed by [and then [EXE]].

Defm
Program: 0
Memory: 56
246 Bytes Free

To initialize the number of memories (to return the number to 26), enter a zero for the value in the memory expansion sequence outlined above.

Defm
Program: 0
Memory: 26
486 Bytes Free

- * Though a maximum of 60 memories can be added, if a program has already been stored and the number of remaining steps is less than the desired expansion, an error will be generated. The size of the memory expansion must be equal to or less than the number of steps remaining.
- * The expansion procedure (wook : expansion value) can also be stored as a program.

Using expanded memories

Expanded memories are used in the same manner as standard memories, and are referred to as Z [1], Z [2], etc. The letter Z followed by a value in brackets indicating the sequential position of the memory is used as the memory name. (Brackets are formed by INPHA of or " [" and INPHA EXP for "] ".) After the number of memories has been expanded by 5, memories Z [1] through Z [5] are available.

The use of these memories is similar to that of a standard computer array, with a subscript being appended to the name. For more information concerning an array, see page 124.

Answer (Ans) function

This unit has an answer function that stores the result of the most recent computation. Once a numeric value or numeric formula is entered and <code>EXE</code> is pressed, the result (the answer in the case of the numeric formula) is stored by this function. To recall the stored value, press the <code>Ass</code> key.

When Ans is pressed, "Ans" will appear on the display, and can be used in this form in subsequent calculations.

* Hereinafter, Ans will be referred to as the Ans memory.

1] 2 3 # 4 5 6 EXE

123+456	
	579
789-Ans	
	210

Numeric values with 13 digits for a mantissa and 2 digits for an exponent can be stored in the Ans memory. The Ans memory is not erased even if the power of the unit is switched OFF. Each time EXE is pressed, the value in the Ans memory is replaced with the new value produced by the computation executed.

When a value is stored to another memory using the EXE key, that value is not stored in the Ans memory.

Ex. Perform computation 78+56=134, then store the value 123 to memory A:

7 8 ⊞ 5 6 EXE

Checking the content of Ans EXE ... Ans memory

1 2 3 → ALPHA EXE

78+56	
A THE STATE OF THE STATE OF	134.
Ans	
	134.
123→A	
	123.
Ans	
	134.

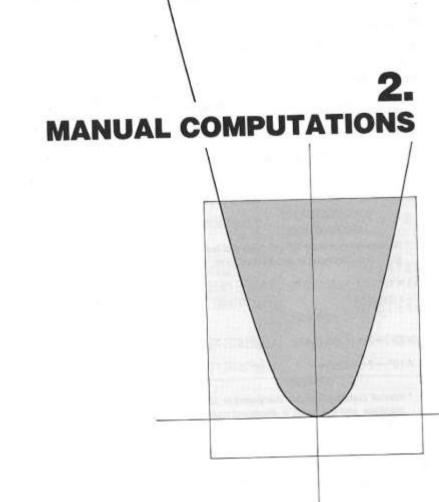

The Ans memory can be used in the same manner as the other memories, thus making it possible to use it in computation formulas. In multiplication operations, the immediately before Ans can be omitted.

[7] [8] [Ans] [-] [2] [3] [EXE]

15×3	
	45.
78Ans-23	
	3487.

Auto power off function

The power of the unit is automatically switched off approximately 6 minutes after the last key operation (except during program computations). Once this occurs, power can be restored either by switching the power of the unit OFF and then ON again, or by pressing the AC key. (Numeric values in the memories, programs or computation modes are unaffected when power is switched off.)

2-1 BASIC COMPUTATIONS

Arithmetic operations

- Arithmetic operations are performed by pressing the keys in the same order as noted in the formula.
- For negative values, press (-) before entering the value.

Example	Operation	Display
23+4.5-53=-25.5	23 ⊞ 4.5 ⊟ 53 EXE	-25.5
$56 \times (-12) \div (-2.5) = 268.8$	56 × (-) 12 ÷ (-) 2.5	268.8
12369×7532×74103= 6.903680613×10 ¹² (6903680613000) * Results greater than 10 ¹⁰ (0.01) are displayed in exp	10 billion) or less than 10-2	6.903680613 _E +12
(4.5×10 ⁷⁵)×(-2.3×10 ⁻⁷⁹)	4.5 EXP 75 X (-) 2.3 EXP	
$= -1.035 \times 10^{-3}$ $= -0.001035$	(-) 79 EXE	-1.035 E-03

- Specifying the number of decimal places, the number of significant digits and the exponent display
- To specify the number of decimal places, press word followed by □, a value indicating the number of places (0−9) and then EXE.
- To specify the number of significant digits, press MoDE followed by B, a value indicating the number of significant digits (0 − 9 to set from 1 to 10 digits) and then EXE.
- Pressing the big key or set followed by (ENG key) will cause the exponent display for the number being displayed to change in multiples of 3.
- The specified number of decimal places or number of significant digits will not be cancelled until another value or MODE ☑ is specified using the sequence: MODE, ☑, EXE. (Specified values are not cancelled even if power is switched OFF or an other mode (besides MODE ☑) is specified.)
- Even if the number of decimal places and number of significant digits are specified, internal computations are performed in 13 digits for a mantissa, and the displayed value is stored in 10 digits. To convert these values to the specified number of decimal places and significant digits, press [SHET] followed by [Red] (100 key) and then [EXE].

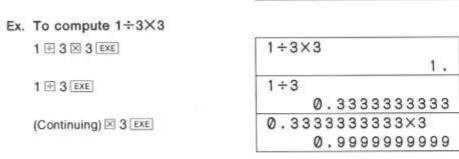

Example	Operation	Display
100÷6=16.66666666	100 ± 6 EXE MODE 77 4 EXE (Four dec-	16.6666667 16.6667

2-2 SPECIAL FUNCTIONS

Continuous computation function

Even if computations are concluded with the <code>EXE</code> key, the result obtained can be used for further computations. In this case, computations are performed with 10 digits for the mantissa which is displayed.

Ex. 3×4=12 Continuing	÷3.14=
3 × 4 EXE	3×4
	12.
(Continuing) 3.14 EXE	12.÷3.14
	3.821656051

This function can be used with memory and Type A functions (x^2 , x^{-1} , x! : see page 44), and +, -, x^* , $\sqrt[4]{}$, \cdots .

Ex. To store the result of 12×45 in memory C:

12 × 45 EXE	12×45	
	1.05.1100.000.000.000.000.000.000.000.00	540.
(Continuing) - ALPHA G EXE	540.→C	
IN THE STATE OF TH		540.

Ex. To square the result of 78 ÷ 6 (see page 44):

78 ± 6 EXE	78÷6	
	, (CANADA	13.
(Continuing) x2 EXE	13.2	
ters make a training	1000000	169.

Replay function

 This function stores formulas that have been executed. After execution is complete pressing either the or key will display the formula executed.

Pressing is will display the formula, with the cursor located under the first character.

Pressing is will display the formula, with the cursor located at the space following the last character.

Then using , and and to move the cursor, the formula can be checked and numeric values or commands can be changed for subsequent execution.

Ex.

Ex. 4.12×3.58+6.4=21.1496 4.12×3.58-7.1=7.6496

4.12 ⊠ 3.58 ⊞ 6.4 EXE	4.12×3.58+6.4
	21.1496
Ф	4.12×3.58+6.4_
66666	4.12×3.58+6.4

• If an error is generated during computation execution, an error check function eliminates the need to clear the error using AC and then restarting input from the beginning. Pressing either AD or AD will automatically move the cursor to the point in the formula that generated the error and display it.

Ex. When $14 \div 0 \times 2.3$ is mistakenly entered for $14 \div 10 \times 2.3$:

14 ± 0 ⋈ 2.3 EXE	14÷0×2.3
	Ma ERROR
	Step 4
⇔ (or ⇔)	14÷0×2.3
	Error generated here.
SHIFT INS 1 EXE	14÷10×2.3
	3.22

- * As with the number of input characters (see page 20), the replay function can accept input up to 127 steps.
- * The replay function is cleared when the AC key is pressed, when power is switched OFF or when the mode is changed.

Multistatement function

- The multistatement function (using colons to separate formulas or statements) available in program computations can also be used for manual computations.
- The multistatement function allows formulas to be separated by colons to make consecutive, multiple statement computations possible.
- When EXE is pressed to execute a formula input using the multistatement format, the formula is executed in order from the beginning.
- Inputting "▲" (SHIFT (1) in place of the colon will display the computational result up to that point during execution.

123→A:6.9×A ⊿ A÷3.2 848.7 — Disp —

The display halted by the ▲ command is represented with -Disp-

EXE

123-A:6.9×A A A÷3.2 848.7 38.4375

- * Even if "▲" is not input at the end of a formula, the final result will be displayed.
- * Consecutive computations using multistatements cannot be performed.

 123×456: +5

 Invalid

2-3 FUNCTIONAL COMPUTATIONS

Angular measurement units

- The unit of angular measurement (degrees, radians, grads) is set by pressing MODE followed by a value from 4 through 6 and then EXE.
- The numeric value from 4 through 6 specifies degrees, radians and grads respectively.
- Once a unit of angular measurement is set, it remains in effect until a new unit is set. Settings are not cleared when power is switched OFF.
- The unit of angular measurement can be checked by pressing the Mose key.

Example	Operation	Display
Conversion of 4.25 rad to degrees	MODE 4 EXE 4.25 SHIFT MODE 5 EXE	243.5070629
Conversion of 1.23 grad to radians	MODE 5 EXE 1.23 SHIFT MODE 6 EXE	0.01932079482

2-4 BINARY, OCTAL, DECIMAL, HEXADECI-MAL COMPUTATIONS

 Binary, octal, decimal and hexadecimal computations, conversions and logical operations are performed in the Base-n mode (press WODE).

● The number system (2, 8, 10, 16) is set by respectively pressing Bin.

Oct, Dec or Hex, followed by EXE.

- Number systems are specified for specific values by pressing [SHIFT], then the number system designator (b, o, d or h), immediately followed by the value.
- General function computations cannot be performed in the Base-n mode.
- Only integers can be handled in the Base-n mode. If a computation produces a result that includes a decimal value, the decimal portion is cut off.
- Octal, decimal and hexadecimal computations can be handled up to 32 bits, while binary can be handled up to 16 bits.

Up to 16 digits Binary Octal Up to 11 digits Up to 10 digits Decimal Hexadecimal Up to 8 digits

 The total range of numbers handled in this mode is 0, 1, 2, 3, 4, 5, 6, 7. 8, 9, A, B, C, D, E, F. If values not valid for the particular number system are used, attach the corresponding designator (b, o, d or h), or an error message will appear.

Valid values

0.1 Binary

0, 1, 2, 3, 4, 5, 6, 7 Octal 0, 1, 2, 3, 4, 5, 6, 7, 8, 9 Decimal

Hexadecimal 0, 1, 2, 3, 4, 5, 6, 7, 8, 9, A, B, C, D, E, F

- Negative numbers in binary, octal and hexadecimal are expressed as two's complements.
- To distinguish the A, B, C, D, E, F used in the hexadecimal system from standard letters they appear as: A, B, C, D, E, F.

Computation range (in Base-n mode)

Positive: 111111111111111 $\ge x \ge 0$ Binary

Negative: 1111111111111111 $\ge x$

2-5 STATISTICAL COMPUTATIONS

Standard deviation

- Standard deviation computations are performed in the SD1 mode. (Press MODE X.)
- Before beginning computations, the statistical memories are cleared by pressing SHIFT followed by Sci (AC key) and then EXE.
- Individual data is input using □T (key).
- Multiple data of the same value can be input either by repeatedly. pressing or by entering the data, pressing self, followed by , that represents the number of times the data is repeated, and then DT.
- Standard deviation

$$\sigma_n = \sqrt{\frac{\sum\limits_{i=1}^n (x_i - \bar{x})^2}{n}} = \sqrt{\frac{\sum\limits_{i=1}^n x^2 - (\sum\limits_{i=1}^n x)^2/n}{n}} = \sqrt{\frac{\sum\limits_{i=1}^n x^2 - (\sum\limits_{i=1}^n x)^2/n}{n}} = \sqrt{\frac{\sum\limits_{i=1}^n (x_i - \bar{x})^2}{n-1}} = \sqrt{\frac{\sum\limits_{i=1}^n (\sum\limits_{i=1}^n x)^2/n}{n-1}} = \sqrt{\frac{\sum\limits_{i=1}^n x^2 - (\sum\limits_{i=1}^n x)^2/n}{n-1}}} = \sqrt{\frac{\sum\limits_{i=1}^n x^2 - (\sum\limits_{i=1}^n x)^2/n}{n-1}} = \sqrt{\frac{\sum\limits_{i=1}^n x^2 - (\sum\limits_{i=1}^n x)^2/n}{n-1}} = \sqrt{\frac{\sum\limits_{i=1}^n x^2 - (\sum\limits_{i=1}^n x)^2/n}{n-1}}} = \sqrt{\frac{\sum\limits_{i=1}^n x^2 - (\sum\limits_{i=1}^n x)^2/n}{n-1}}}$$

deviation for the population.

$$x = \frac{\sum_{i=1}^{n} x_i}{n} = \frac{\sum x}{n}$$

* The values for $n, \Sigma x$, and Σx^2 are stored in memories W, V, and U respectively, and can be obtained by pressing ALPHA followed by the memory name and then EXE (i.e. ALPHA W EXE).

- 4 If 120 SHIFT : 30 DT was entered previously, enter correct data after pressing 120 SHIFT : 30 CL.

Regression computation

- Regression computations are performed in the LR1 mode. (Press MODE ⊕.)
- Before beginning computations, the tabulation memories are cleared by pressing ser followed by sel and then Exe.
- Individual data are entered as x data self y data or.
- Multiple data of the same value can be entered by repeatedly pressing DT. This operation can also be performed by entering x data SHIFT I followed by a value representing the number of times the data is repeated, and then DT.
- If only x data is repeated (x data having the same value), enter y data y data y or y data y data
- If only y data is repeated (y data having the same value), enter x data
 DT or x data SHIFT : followed by a value representing the total number of times the data is repeated, and then DT.
- The regression formula is y=A+Bx, and constant term A and regression coefficient B are computed using the following formulas:

Regression coefficient of regression formula

Constant term of regression formula

$$B = \frac{n \cdot \sum xy - \sum x \cdot \sum y}{n \cdot \sum x^{2} - (\sum x)^{2}}$$

$$A = \frac{\sum y - B \cdot \sum x}{n}$$

- ullet Estimated values \hat{x} and \hat{y} based on the regression formula can be computed.
- The correlation coefficient r for input data can be computed using the following formula:

$$r = \frac{n \cdot \sum xy - \sum x \cdot \sum y}{\sqrt{|n \cdot \sum x^2 - (\sum x)^2| - |n \cdot \sum y^2 - (\sum y)^2|}}$$

* The values for $n, \Sigma x, \Sigma x^2, \Sigma xy, \Sigma y$, and Σy are stored in memories W, V, U, R, Q and P respectively, and can be obtained by pressing followed by the memory name and then EXE (i.e. ALPHA \blacksquare EXE).

Logarithmic regression

- The regression formula is y=A+B·Inx. Enter the x data as the logarithm (In) of x, and the y data inputs the same as that for linear regression.
- The same operation as with linear regression can be used to obtain the regression coefficient and for making corrections. To obtain the estimated value \hat{y} , in x shift \hat{y} EXE is used, and to obtain estimated value \hat{x} , y shift \hat{y} EXE shift \hat{y} (Ans) EXE is used.

Furthermore, Σx , Σx^2 , and Σxy are obtained as $\Sigma \ln x$, $\Sigma (\ln x)^2$, and $\Sigma \ln xy$ respectively.

-1 BUILT-IN FUNCTION GRAPHS

The COMP mode of the RUN mode should be used when graphing functions. Some graphs can be produced in the SD and LR modes, but certwin graphs cannot be produced in these modes. The Base-n mode cannot be used for graphs. This unit contains a total of 20 built-in graphs making it possible to produce the graphs of basic functions.

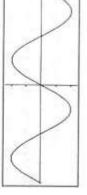

* \sin * \cos * \tan * \sin^{-1} * \cos^{-1} * \tan^{-1} * \sinh^{+1} * \cosh^{-1} * \tanh^{-1} * e^{x} * \log * \ln * 10^{x} * e^{x} * Not available with the fx-6000G

Any time a built-in graph is executed, the ranges (see page 62) are automatically set to their optimum values, and the graph is divided in three

parts and displayed. Any graph previously on the display is cleared

Ex. 1) Sine curve

MODE ±

Graphs are originally displayed with the x-y intersection centered on the screen. Pressing the 9 or 4 key respectively displays the portion of the graph above the x-axis, and the portion below the x-axis.

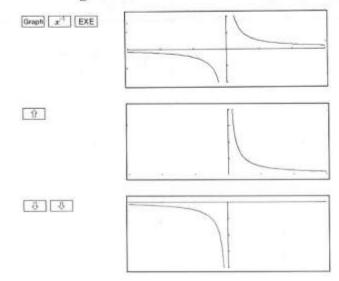

The graph function of this unit makes it possible to produce a wide variety of function and statistical graphs quickly and easily on a 95 X 32 dot display. (Top line is not used.)

Besides the built-in function graphs, a generous selection of functions can also be input for graphic representation.

Graph commands can be used manually or in programs, but here all examples will be centered around manual operations. Programmed graphs are identical to those produced manually, and details can be found on page 128.

 Some of keys used for the operation examples in this manual show alphabetic character key markings. On the actual unit, alphabetic characters are marked under the keys by which they are represented.

Ex. 2)
$$y = \frac{1}{x}$$
 graph

* This function can also be performed with user-generated function graphs after making the x-y pitch ratio 1:1 using the MODE O operation.

Overwriting built-in function graphs

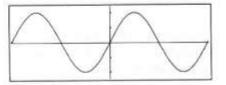

Two or more different built-in function graphs can be written together on the same display. Since the range for the first graph is automatically set, all subsequent graphs on the same display are produced according to the range of the first graph.

The first graph is produced by using the previously mentioned operation (Graph [function key] EXE).

Subsequent graphs are produced using the variable X in the operation [function key] ALPHA IN EXE (IN: H) key). By inputting ALPHA IN after the function key, the range is unchanged and the next graph is produced without clearing the existing display. (See page 68 for details.)

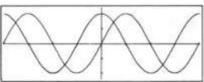

Ex. Overwrite the graph for $y = \cos x$ on the graph for $y \sin x$. First, draw the graph for $y = \sin x$.

Graph Sin EXE

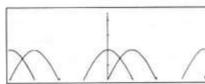

Next, draw the graph for $y=\cos x$ without changing the existing range.

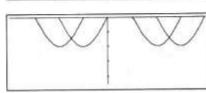

Graph GOS ALPHA X EXE

.0

9 9

(Note)

Built-in function graphs cannot be used in multistatements (see page 38) and cannot be written into programs.

3-2 USER GENERATED GRAPHS

Built-in function graphs can also be used in combination with each other. Graphing a formula such as $y=2x^2+3x-5$ makes it possible to visually represent the solution.

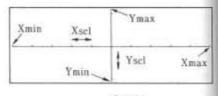

Unlike built-in functions, the ranges of user generated graphs are not set automatically, so graphs produced outside of the display range do not appear on the display.

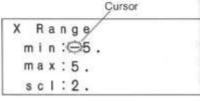

Ranges

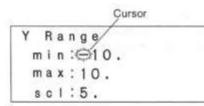

The ranges of the x and y-axes, as well as the scale (distance between points) for both axes can be set or checked using the $\frac{1}{2}$ key.

Ranges contents
 Ranges consist of Xmin (x-axis minimum value), Xmax (x-axis maximum value), Xscl (x-axis scale), Ymin (y-axis minimum value), Ymax (y-axis maximum value), and Yscl (y-axis scale).

Range display Each press of the week key switches between the x-range display and the y-range display. Range values can be changed at the current cursor position.

Values shown here are only an example.
 Actual values may differ.

Range setting

Range settings are made from the current cursor position and proceed in the order of Xmin→Xmax→Xscl→Ymin→Ymax→Yscl. Input a numeric value at the cursor position and then press EXE. Any value input while the cursor is at the first (extreme left) digit of the displayed value will replace the displayed value when EXE is pressed.

If the key is used to move the cursor to the second or subsequent digit of the displayed value, only the portion of the displayed value starting from the cursor position will be affected by the new input when EXE is pressed.

Here, let's try changing the currently set range values to those listed below:

Xmin	-+	0	Ymin	\rightarrow	-5
Xmax	-+	5	Ymax	\rightarrow	15
Xscl	-	1	Yscl	\rightarrow	5

1 Input 0 for Xmin.

0 EXE

Χ	Range	
r	nin:Ø.	
Г	nax :{5}.	
	sc1:2.	

(2) The Xmax value is the same, so simply press EXE.

EXE (b key can also be used.)

X Range	
min:0.	
max:5.	
s c 1 (2).	

③ Input 1 for Xscl.

1 EXE

* The range setting display change to the y-range at this point.

Y R	a	n g e	
m i	n	:⊝10.	
m a	X	:10.	
SC	١	:5.	

④ To change Ymin to -5, use the □ key to move the cursor one digit to the right and input 5.

⇒ 5 EXE

Y Range min: -5 max: 10. scl: 5.

(5) To change Ymax to 15, use the (so key to move the cursor one digit to the right and input 5.

⇒ 5 EXE

Y Range min:-5 max:15. scl:5.

6 The Yscl value is the same, so simply press EXE.

EXE

Once all settings are complete, the display that was shown before pressing the hope key is retrieved.

Press the Renge key again to confirm whether settings are correct.

Range

X Range
min: 0:.
max: 5.
scl: 1.

Flange

* Pressing the Regel key again will display the y-range. Y Range min:⇔5. max:15. scl:5.

The ① and ③ keys can be used to move the cursor from line to line in the range display without affecting the range values. The cursor can only be moved upwards as far as Xmin, and downwards as far as Yscl. Press the [Resp] key while the y-range is being displayed to return to the display that was shown before entering the range display.

- * The input range for graph ranges is −9.9999_ε+98 through 9.99999_ε+98.
- * Only numeric value keys from ① through ②, ①, EXP, ①, ②, ⑤, ②, ②, ③, and Parge can be used during range display. Other key operation is ignored.

(Use the [-] key for negative value input.)

* To completely change an existing range setting, ensure that the cursor is located at the first digit (all the way to the left) of the displayed value. If the cursor has been moved to another digit of the value, only the portion of the value from the cursor position (to the right) will be changed. The portion of the value to the left of the cursor will remain unchanged.

Ex.

0

3 EXE

⊕25	
-25	
-35	
-3	

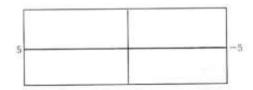

- Values up to nine significant digits can be input.
 Values less than 10⁻² and equal to or greater than 10⁸ are displayed with a 6-digit mantissa (including negative sign) and a 2-digit exponent.
- If input is improper (outside the allowable calculation range or inputting only a negative sign), the existing value will remain unchanged. (The improper input, however, will be temporarily displayed.)

* Inputting 0 for XscI or YscI does not set any scale.

* Inputting a maximum value that is less than the minimum value will reverse the respective axis.

Ex. Xmin: 5

Xmax: -5

^{*} If the maximum and minimum values of an axis are equal, an error (Ma ERROR) will be generated when an attempt is made to produce a graph.

- "When a range setting is used that does not allow display of the axes, the scale for the y-axis is indicated on either the left or right edge of the display, while that for the x-axis is indicated on either the top or bottom edge. (In both cases, the location of the scale is the edge which is closest to the origin (0, 0)).
- * When range values are changed (reset), the graph display is cleared and the newly set axes only are displayed.
- * Range settings may cause irregular scale spacing.
- * If the range is set too wide, the graph produced may not fit on the display.
- * Points of deflection sometimes exceed the capabilities of the display with graphs that change drastically as they approach the point of deflection.
- * An Ma ERROR may be generated when a range value is specified that exceeds the allowable range.

Ex. Xmin $9.\epsilon99$ Xmax $9.9\epsilon99$ Xscl $1.\epsilon99 \Rightarrow$ Falls outside of range.

- * An Ma ERROR is generated when ranges are extremely narrow.
- Range reset

Range values are reset to their initial values by pressing SHIFT DEL during range display.

Range (Not required when range display is already being shown.)

X Range min:-4.7 max:4.7 scl:1.

Ranger

Y Range min:-3.1 max:3.1 scl:1.

(Reference)

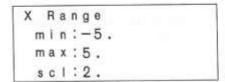

Range settings are performed within programs using the following format:

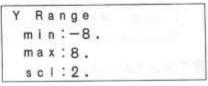

Timos Xmin value, Xmax value, Xscl value, Ymin value, Ymax value, Yscl value

Up to six data items are programmed after the Renge command. When less than six items are programmed, range setting is performed in the order from the beginning of the above format.

User generated function graphs

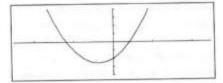

After performing range settings, user generated graphs can be drawn simply by entering the function (formula) after pressing Graph. Here, let's try drawing a graph for $y=2x^2+3x-4$. Set the ranges to the values shown below.

Input the functional formula after pressing the Graph key.

The result produces a visual representation of the formula.

Pressing the or key directly after a graph is drawn activates the replay function which allows the values to be changed, and writing of the graph using the new values.

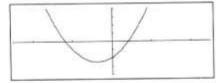

■ Function graph overwrite

Two or more function graphs can be overwritten which makes it easy to determine intersection points and solutions that satisfy all the equations.

Ex. Here, let's find the intersection points of the previously used $y=2x^2+3x-4$ and y=2x+3.

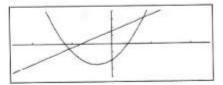

First, clear the graph screen in preparation for the first graph.

Next, overwrite the graph for y=2x+3.

Graph 2 ALPHA 13 1 3 EXE

In this way it can be easily seen that there are two intersections for the two function graphs. The approximate coordinates for these two intersections can be found using the trace function described in the following section.

- * Be sure to input variable X (ALPHA III) into the function when using built-in graphs for overwrite.
- If variable X is not included in the second formula, the second graph is produced after clearing the first graph.

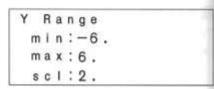

Trace function

The pointer (blinking dot) can be moved using the cursor keys (\Rightarrow) to determine the x and y coordinates of any point on a graph.

After a graph is produced on the display, press $\overline{\text{MFF}}$ $\overline{\text{Mace}}$ and the point will appear at the extreme left plot of the graph. The x-coordinate value (X=...) will appear on the bottom line of the display. The pointer can be moved using the \bigcirc and \bigcirc cursor keys, and the x-coordinate value changes as the pointer moves. To change from the x-coordinate to the y-coordinate value, press $\boxed{\text{MFF}}$ $\boxed{\text{X--v}}$. The displayed coordinate switches between x and y with each press of $\boxed{\text{MFF}}$ $\boxed{\text{X--v}}$.

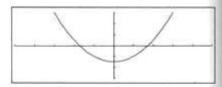

Ex. Determine the points of intersection of the graphs for $y = x^2 - 3$ and y = -x + 2.

The range values should be set as follows:

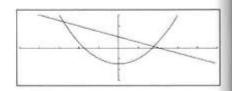

First, draw the graph for $y=x^2-3$.

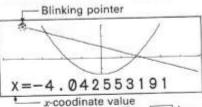

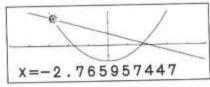

Next, draw the graph for y=-x+2.

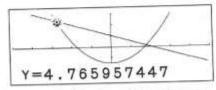

Finally, let's use the trace function.

The pointer appears at the extreme left plot of the graph. The key moves the pointer to the right along the graph. Each press of moves the pointer one point, while holding it down causes continuous movement.

Hold rightarrow down until the pointer reaches the intersection of the two graphs. Note the x-coordinate value, and then press rightarrow for the y-coordinate value.

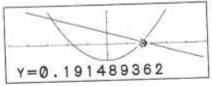

In this way, it can be determined that the coordinates of the first intersection are x=-2.765957447 and y=4.765957447.

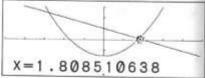

* The pointer does not move at the fixed distance because the distance is located along the dots of the display. Therefore, the x-y coordinates for the point of intersection are approximate values.

Similarly, press to move the pointer to the next point of intersection.

This time, press [x-y] to display the x-coordinate value.

The coordinate values displayed on the bottom of the display will switch in the following order with each press of x - x coordinate x - x coordinate, etc.

Using the operations outlined above, the approximate x-y coordinates for points along graphs can be obtained.

- * The trace function can only be used immediately after a graph is drawn. This function cannot be used if other calculations or operations (except Money, Resp., or O-T) have been employed after a graph has been drawn.
- The x-y coordinate values at the bottom of the display consist of a 10-digit mantissa or a 5-digit mantissa plus a 2-digit exponent.
- * The trace function cannot be written into a program.
- * The trace function can be used during a "-DISP-" display.

Plot function

The plot function is used to mark a point on the screen of a graph display. The point can be moved left, right, up and down using the cursor keys, and the coordinates for the graph displayed can be read. Two points can also be connected by a straight line (see Line function, page 72).

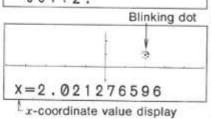

Press [SHET] Piot and specify the x and y-coordinates after the "Plot" message.

Ex. Plot a point at x=2 and y=2 on the axes created by the following range values:

X Range min:-5. max:5. scl:1.

Y Range
min:-5.
max:5.
scl:2.

SHIFT Plot 2 SHIFT , 2 EXE

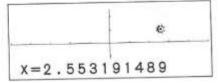

The blinking pointer is positioned at the specified coordinates.

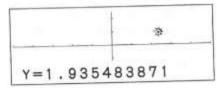

* Due to limitations caused by the resolution of the display, the actual position of the pointer can only be approximate.

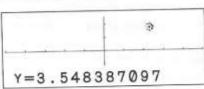

The pointer can be moved left, right, up, and down using the cursor keys. The current position of the pointer is always shown at the bottom of the display.

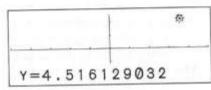

To find the y-coordinate value:

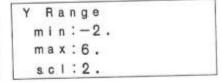

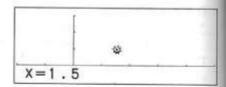

Now, inputting a new coordinate value causes the new pointer to blink without clearing the present pointer.

If x-y coordinates are not specified for the plot function, the pointer appears at the center of the screen. Set the following range values:

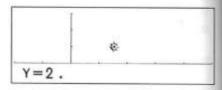

SHIFT Plot EXE

To find the Y-coordinate value:

SHIFT X++Y

- * Attempting to plot a point outside of the preset range is disregarded.
- * The x and y-coordinates of the pointer used in the plot function are respectively stored in the X memory and Y memory.
- * A blinking pointer becomes a fixed point (not blinking) when a new pointer is created.
- * The coordinate values displayed on the bottom of the display will switch in the following order with each press of [MET] x-coordinate → y-coordinate → clear → x-coordinate, etc.

Line function

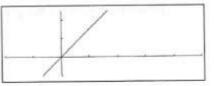

The line function makes it possible to connect two points (including the blinking pointer) created with the plot function with a straight line. With this function, user generated lines can be added to graphs to make them easier to read.

Ex. Draw perpendiculars from point (1,0) on the x-axis to its intersection with the graph for y=3x. Then draw a line from the point of intersection to the y-axis.

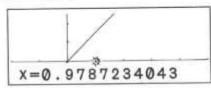

The range values for the graph are as follows:

Clear the graph display and draw the graph for y=3x.

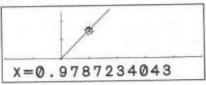

Next, use the plot function to locate a point at (1,0)

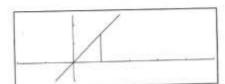

Now plot a point at (1,0) again and use the cursor key (\bigcirc) to move the pointer up to the point on the graph (y=3x).

(Move the pointer up to the point on the graph for y=3x.)

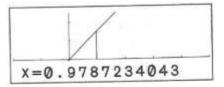

Draw a line using the line function.

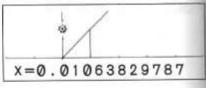

Next, a perpendicular will be drawn from the same point on the graph to the y-axis. First, plot the point on the graph and use the cursor key (\bigcirc) to move the pointer to the y-axis. This can be accomplished using Plot X, Y since the x-y coordinates of the point on the graph are stored in the X and Y memories.

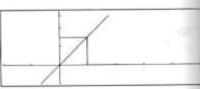

SHIFT Line EXE

* The line function can only be used to draw lines between the blinking pointer and a fixed point created using the plot function.

Factor function

The factor function is used to magnify or reduce the range of a graph centered around the blinking pointer provided with the plot function or trace function.

For magnification, the minimum value and maximum value of the range are multiplied by 1/n. For reduction, they are multiplied by n.

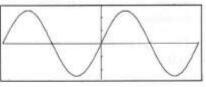

Operation

The graph display is cleared when the factor function is executed because of changes in the range values.

Ex. After setting the range values specified below, magnify the graph for $y=\sin x$ centered on the origin.

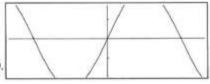

Draw the graph for $y=\sin x$ after setting the range values.

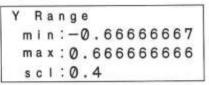

Now use the plot function to blink the pointer at the origin of the graph and then use the factor function to magnify the graph 1.5 times.

 The multistatement function is used to produce the graph in a single step.

The following shows the resulting range values:

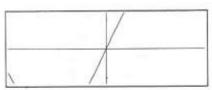

This indicates that the range values for the x and y-axes are equal to 1/1.5 of their original values.

Now let's try magnifying the graph another 1.5 times.

This time, it is not necessary to input any further commands. The existing graph is magnified by simply pressing [EXE]. Since the original magnification was accomplished using the multistatement function, the replay function becomes operational.

EXE

Now the graph is so large that little of it remains on the display. Let's try to reduce the graph to half its present size to make it more manageable.

The replay function is used to change the magnification value from 1.5 to 0.5.

⇒

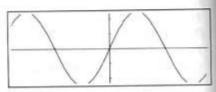

0 0 0

Plot : Factor
$$\underline{1}$$
.5
: Graph Y=sin X

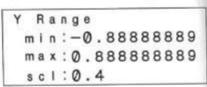

0

Now execute the function.

EXE

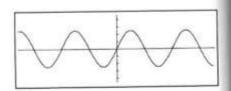

The following display shows the new range values:

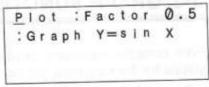

To reduce the graph by half again:

EXE

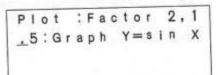

Now let's double the x-axis and increase the y-axis by 1.5 times.

动

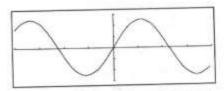

2 SHIFT INS 1

Now execute the function.

EXE

Using the operations outlined in this section, graphs can be magnified or reduced. In the examples given here, the graphs were magnified and reduced centered around the origin, but any pointer on the display can be used as a central point for magnification and reduction.

Furthermore, graphs can also be automatically magnified and reduced with the center of the screen of the base without the pointer when using the factor function.

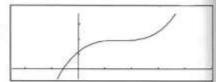

3-3 GRAPH FUNCTION APPLICATIONS

Even complex equations can be graphically represented. A number of graphs for the equations will be presented in this section.

Ex. 1) Draw the graph for the third degree equation, $y=x^3-9x^2+27x+50$.

The range values for the graph are given as follows.

Operation

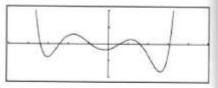

Ex. 2) Draw the graph for the polynomial equation,
$$y=x^6+4x^5-54x^4-160x^3+641x^2+828x-1260$$
.

The range values for the graph are given as follows.

Υ		R	a	n	g	е
	m	i	n	:	_	8000.
	m	a	X	:	8	000.
	s	C	1	:	4	000.

Operation

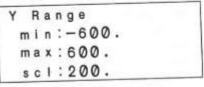

■ 1260 EXE

Ex. 3) Find the maximum and minimum for the equation, $y=x^4+4x^3-36x^2-160x+300$.

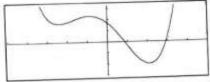

* If this equation is graphed, the minimum and maximum can be easily understood without differentiation.

The range values for the graph are given as follows.

Operation

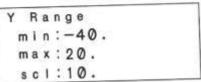

Ex. 4) Determine whether the two graphs for equations, $y=x^3-3x^2-6x-16$ and y=3x-11 have a point of tangency.

The range values for the graph are given as follows.

Х	R	a	n	gе	
m	1	n	:	-10.	
m	a	X	:	10.	
	c	1		2.	

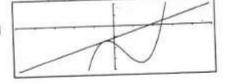

Operation

Graph ALPHA ■ xº 3 □ 3 ALPHA ■ x² □
6 ALPHA ■ □ 16 EXE

Graph 3 ALPHA M - 11 EXE

3-4 SINGLE VARIABLE STATISTICAL GRAPHS

- Single variable statistical graphs are drawn in the SD2 mode (SHIFT MODE).
- Bar graphs, line graphs, and normal distribution curves can be produced as single variable statistical graphs.
- Function graphs are also possible in the SD2 mode, so graphs of theoretical values and graphs of actual values can be overwritten.
- * Abs and V cannot be used in the SD2 mode.
- Number of data is determined by expanding memories.
- Graphs are drawn with the x-coordinate as the data range and the ycoordinate as the number of items (frequency) of each data.
- The DT key (17) is used for data input.
- The CL key () is used for data correction.

Drawing single variable statistical graphs

- Procedure
- Specify the SD2 mode (SHIFT MODE ⋈).
- ② Set the range values (Range).
- 3 Expand the memory in accordance with the number of bars ($\underbrace{\text{MODE}} \ \ n$
- 4 Clear the statistical memories (SHIFT ScI EXE).
- ⑤ Input data (Data ot ()).
- 6 Draw the graph.

 - Line graph Gruph SHIFT Line EXE

 - * Data input method in step 5 is the same as that for standard deviation computations (see page 50).

Ex. Use the following data to draw a ranked graph.

Rank No.	Rank	Frequency
1	0	1
2	10	3
3	20	2
4	30	2
5	40	3
6	50	5
7	60	6
8	70	8
9	80	15
10	90	9
11	100	2

Perform graph preparation in accordance with the following procedure:

- ① Specify the SD2 mode (SHIFT MODE X).
- 2) Set the range values.

The highest value to be plotted on the x-axis is 100, but for graphing purposes the maximum value (Xmax) is set at 110. (The general rule is that the minimum value should be equal to or greater than the minimum range value and the maximum value should be less than the maximum range value, so here we set the x-axis ranges to 0 through 110.)

Ymax value is set to 20 for the y-axis because the maximum frequency is 15.

T	Х	R	a	n	9	е
	m	1	n	:	0	١.
1	m	a	x	:	1	10.
1	s	С	1	:	1	0.

Υ	1	R	a	n	g	е		
m	1	i	n	:	0			
n	1	a	X	:	2	0		
8		C	1	:	2			

Since the number of bars is 11(0~9, 10~19, 20~29. . . . 100~109) expand memories by 11.

*	*	D	0	1	m	*	*								
	P	r	0	g	r	a	m		:		6	4			
		M	0	m	0	г	у		:		3	7			
		3	9	8		В	у	t	е	S		F	r	е	е

④ Clear the statistical memory.

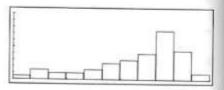

SHIFT SOI EXE

⑤ Input the data.

0 DT 10 DT DT DT 20 DT DT 30 DT DT 40 DT DT 50 SHIFT; 5 DT 60 SHIFT; 6 DT 70 SHIFT; 8 DT 80 SHIFT; 15 DT 90 SHIFT; 9 DT 100 DT DT

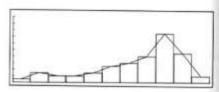

6 First, draw a bar graph.

Graph EXE

Next, overwrite a line graph.

Graph SHIFT Line EXE

 Finally, draw a normal distribution curve. Since the y-axis value is relatively small when compared with the bar and line graphs, the same range values cannot be used. Change the range values to those shown below.

X Range min:0. max:110. scl:10.

Y Range min:0. max:0.025 scl:0.01

Graph SHIFT Line 1 EXE

Inputting the number 1 causes a normal distribution curve to be drawn.

(Summary)

- Be sure to expand the memory in accordance with the number of bars.
 A Mem-error is generated if memory expansion is not performed.
- If the number of expanded memories is changed during data input, the number of data divisions also changes, thus making it impossible to produce a proper graph.
- When a value that exceeds the preset ranges is input, it is input to the statistical memory, but not into the graph memory.
- When more data than the preset y-axis range is input, the bar graph is drawn to the upper limit of the display, and the points outside the range cannot be connected.
- The formula used for normal distribution curves is:
 (x−x)²

$$y = \frac{1}{\sqrt{2\pi} x \sigma n} e^{-\frac{(x-x)^2}{2x \sigma n^2}}$$

 After a bar or line graph is executed, "done" is displayed in the text display.

3-5 PAIRED VARIABLE STATISTICAL GRAPHS

- Paired variable graphs are drawn in the LR2 mode (SHIFT MODE ±).
- Paired variable graphs can be drawn as regression lines.
- Standard function graphs can also be drawn in the LR2 mode, so theoretical graphs, data distribution and regression line graphs can be overwritten.
- After data input in the LR2 mode, points are displayed immediately, and data is input to the statistical memory.
- When a value that exceeds the preset range is input, it is input to the statistical memory, the point is not displayed.
- Data is input using the DT (™) key in the following format: x data
 SHIFT D y data SHIFT D frequency DT.
- The CL () key is used to edit data after input is complete, but points that are produced on the display are not cleared. (Point appears even when data is corrected by the CL key).
- Points on the display cannot be retrieved if the display is cleared (SHIFT CIS EXE).

Drawing paired variable statistical graphs

- Procedure
- 1 Specify the LR2 mode (SHFT MODE +).
- ② Set the range values (Rarge).
- 3 Clear the statistical memory (SHIFT ScI EXE).
- 4 Input data (x data SHIFT : y data SHIFT : frequency DT).
- 5 Draw the graph (Graph SHIFT Line 1 EXE).
 - Data input method in step 4 is the same as that for Regression computation (Page 52).
 - Ex. Perform linear regression on the following data and draw a regression line graph.

x_i	y_i
-9	-2
-5	-1
-3	2
1	3
4	5
7	8

- Specify the LR2 mode (SHIFT MODE ⊕).
- ② Set the range values to those shown in the table.

X Range min:-10. max:10. scl:2.

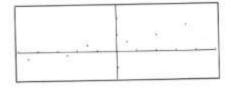

F	a		g e	
m i	n	:	-5	
m a	X	:	15	
8 (: 1	:	5.	(

- * According to the general rule of the x-axis range values, the values for x are: $-10 \le x < 10$.
- ③ Clear the statistical memories.

SHIFT ScI EXE

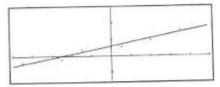

4 Input the data.

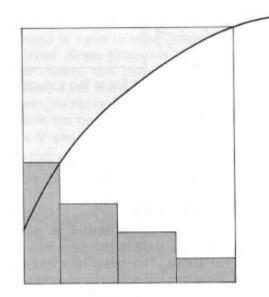

⑤ Draw the graph.

- When data is input that is outside of the preset range values, a point does not appear.
- * An Ma ERROR is generated when there is no data input and the following key operation is performed: Graph SHIFT Line 1 EXE.

4. PROGRAM COMPUTATIONS

4-1 WHAT IS A PROGRAM?

This unit has a built-in program feature that facilitates repeat computations. The program feature is used for the consecutive execution of formulas in the same way as the "multistatement" feature is used in manual computations. Programs will be discussed here with the aid of illustrative examples.

EXAMPLE:

Find the surface area and volume of a regular octahedron when the length of one side is given.

Length of one side (A)	Surface area (S)		Volu	ıme (V)
10cm	() cm²	() cm ^a
7	()	()
15	()	()

^{*} Fill in the parentheses.

1 Formulas

For a surface area S, volume V and one side A, S and V for a regular octahedron are defined as:

$$S=2\sqrt{3}A^{2}$$
 $V=\frac{\sqrt{2}}{3}A^{3}$

2 Programming

Creating a program based on computation formulas is known as "programming". Here a program will be created based upon the formulas given above. The basis of a program is manual computation, so first of all, consider the operational method used for manual computation.

In the above example, numeric value A is used twice, so it should make sense to store it in memory A before the computations.

A "?" within a program will cause execution to stop temporarily and a "?" to appear on the display as the unit waits for data input. This command cannot be used independently, and is used together with as " serious memory name". To store a numeric value in memory A, for example:

When "?" is displayed, calculation commands and numeric values can be input within 111 steps.

The "\[\lambda \]" command causes program execution to stop temporarily and the latest formula result or alphanumeric characters and symbols (see page 125) to be displayed. This command is used to mark positions in formulas where results are to be displayed. Since programs are ended and their final results displayed automatically, this command can be omitted at the end of a program. However, if the Base-n mode is specified for base conversion during a program, do not omit the final "\[\lambda \]". Here these two commands will be used in the previously presented procedure:

Input to memory A Display S

Now the program is complete.

3 Program storage

The storage of programs is performed in the WRT mode which is specified by pressing [MODE] 2 .

Operation MODE 2 WRT : COMP Deg : Norm 486 Bytes Free Prog 0123456789

When MODE 2 are pressed, the system mode changes to the WRT mode. Then, the number of remaining steps (see page 102) is indicated. The number of remaining steps is decreased when programs are input or when memories are expanded. If no programs have been input and the number of memories equals 26 (the number of memories at initialization), the number of usable steps should equal 486.

The larger figures located below indicate the program areas (see page 104). If the letter "P" is followed by the numbers 0 through 9, it indicates that there are no programs stored in areas P0 through P9. The blinking zero here indicates the current program area is P0.

Areas into which programs have already been stored are indicated by "_" instead of numbers.

WRT		COMP
Deg	1	Norm
312	Byt	es Free
Prog	01_	34_6789

Here the previously mentioned program will be stored to program area P0 (indicated by the blinking zero):

Operation	Display
EXE (Start storage)	_
SHIFT ? → ALPHA ■ 2 ⊠ √ 3 ⊠ ALPHA ■ *** SHIFT **	?→A:2×√3×A²₄ —
2 ± 3 × ALPHA A	7→A:2×√3×A² ₄
x* 3	√2÷3×A x "3_

After these operations are complete, the program is stored.

* The system display appears only while the Mosi key is pressed.

Mose (Displayed while pressed)	* *	*		MODE	***
	W	/R	Т	:	COMP
	D	е	g	:	Norm
		S	t	ep P	0-20

^{*} After the program is stored, press MODE [1] to return to the RUN mode.

4 Program execution

Programs are executed in the RUN mode (MODE 1). The program area to be executed is specified using the Program key.

To execute P0: Prog 0 EXE
To execute P3: Prog 3 EXE
To execute P8: Prog 8 EXE

Here the sample program that has been stored will be executed. The surface (S) and volume (V) for the regular octahedron in the sample problem are computed as:

Length of one side (A)	Suface area (S)	Volume (V)
10cm	(346.4101615)cm²	(471,4045208)cm ³
7	(169.7409791)	(161,6917506)
15	(779.4228634)	(1590,990258)

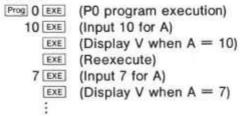

Operation	Display	
MODE 1	*** MODE ***	
	RUN : COMP

		1590.990258	

^{*} Program computations are performed automatically with each press of EXE when it is pressed after data is input or after the result is read.

* Directly after a program in P0 is executed by pressing Prog 0 EXE as in this example, the Prog 0 command is stored by the replay function. Therefore, subsequent executions of the same program can be performed by simply pressing EXE.

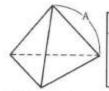

Operation

4-2 PROGRAM CHECKING AND EDITING (CORRECTION, ADDITION, DELETION)

EXAMPLE:

Find the surface area and volume of a regular tetrahedron when the length of one side is given.

Length of one side (A) Su		Surface area (S)		ume (V)
10 cm	()cm²	()cm³
7.5	()	()
20	()	()

1 Formulas

For a surface area S, volume V and one side A, S and V for a regular tetrahedron are defined as:

$$S = \sqrt{3} A^2$$
 $V = \frac{\sqrt{2}}{12} A^3$

2 Programming

As with the previous example, the length of one side is stored in memory A and the program then constructed.

When the above is formed into a program, it appears as follows:

3 Program editing

First, a comparison of the two programs would be helpful.

The octahedron program can be changed to a tetrahedron program by deleting the parts marked with wavy lines, and changing those that are marked with straight lines.

In actual practice, this would be performed as follows:

Operation	Display	
MODE 2	WRT : COMP	
	Deg : Norm	
	466 Bytes Free	
	Prog _123456789	
EXE	?→A:2×√3×A² ₄ √2÷3×A x "3	Cursor located at beginning.
		•
0 0 0 0	7 → A : √3×A² ₄	Locate cursor at position to be de-
DEL DEL	√2÷3×A x "3	leted, and delete
		two characters.
	?→A:√3×A² ₄	Insert two charac
INS 12	√2÷123XAx*3	ters.

(Summary)

	Operation	Keys used
Program check	WRT mode specification Program area specification (Omitted if P0) Start verification Verification of contents	MODE 2 G= G EXE G= G G
Correction	 Move the cursor to the position to be corrected. Press correct keys. 	C 0 0 0
Deletion	Move the cursor to the position to be deleted. Delete	DEL DEL
Insertion	 Move the cursor to the position to be inserted into. Specify the insert mode. Press desired keys. 	¢□ □ ♥ Ø

(Reference)

Cursor movement

Pressing the cursor keys (, , , ,) causes the cursor to move as follows:

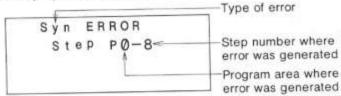

Cursor position	42	[10]	Û.	[4]
(A) (B) (C) (D)		1 position right 1 position right 1 position right (B) Invalid		1 line down (B) End of line (D) 1 line down (D) Invalid

4-3 PROGRAM DEBUGGING (CORRECTING ERRORS)

After a program has been created and input, it will sometimes generate error messages when it is exeuted, or it will produce unexpected results. This indicates that there is an error somewhere within the program that needs to be corrected. Such programming errors are referred to as "bugs", while correcting them is called "debugging".

Debugging when an error message is generated

An error message is displayed as follows:

The error message informs the operator of the program area (P0 to P9) in which the error was generated. It also states the type of error, which gives an idea of the proper countermeasure to be taken. The step number indicates in which step of the program area the error was generated.

Error messages

There are a total of seven error messages.

- Syn ERROR (Syntax error)
 Indicates a mistake in the formula or a misuse of program commands.
- (2) Ma ERROR (Mathematical error) Indicates the computation result of a numeric expression exceeds 10¹⁰⁰, an illogical operation (i.e. division by zero), or the input of an argument that exceeds the input range of the function.
- ③ Go ERROR (Jump error) Indicates a missing Lbl for the Goto command (see page 109), or that the program area (see page 104) for the Prog command (see page 116) does not contain a program.
- 4 Ne ERROR (Nesting error) Indicates a subroutine nesting overflow by the Prog command.

- (5) Stk ERROR (Stack error) Indicates the computation performed exceeds the capacity of the stack for numeric values or for commands (see page 16).
- 6 Mem ERROR (Memory error) Indicates the attempt to use a memory name such as Z [5] without having expanded memories.
- 7 Arg ERROR (Argument error) Indicates the argument of a command or specification in a program exceeds the input range (i.e. Sci 10, Goto 11).

Further operation will become impossible when an error message is displayed. Press AC, , or to cancel the error.

Pressing AC cancels the error and new key input becomes possible. With this operation, the RUN mode is maintained.

Pressing or cancels the error and changes the system mode to the WRT mode. The cursor is positioned at the location where the error was generated to allow modification of the program to eliminate the error.

Checkpoints for each type of error

The following are checkpoints for each type of error:

- Syn ERROR
 Verify again that there are no errors in the program.
- ② Ma ERROR For computations that require use of the memories, check to see that the numeric values in the memories do not exceed the range of the arguments. This type of error often occurs with division by 0 or the computation of negative square roots.
- 3 Go ERROR Check to see that there is a corresponding Lbl n when Goto n is used. Also check to see that the program in P n has been correctly input when Prog n is used.
- 4 Ne ERROR Check to ensure that the Prog command is not used in the branched program area to return execution to the original program area.
- (5) Stk ERROR Check to see that the formula is not too long thus causing a stack overflow. If this is the case, the formula should be divided into two or more parts.

- 7 Arg ERROR Check whether values specified by MCDE (Sci) or MCDE (Fix) are within the range of 0 ~ 9. Also check whether values specified by Goto, LbI, or Prog commands are within 0−9. Also ensure that memory expansion using MCDE (Defm) is performed within the remaining number of steps and that the value used for expansion is not negative.

4-4 COUNTING THE NUMBER OF STEPS

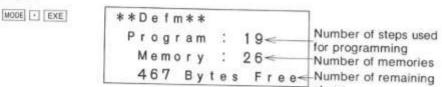

The program capacity of this unit consists of a total of 486 steps.

The number of steps indicates the amount of storage space available for programs, and it will decrease as programs are input. The number of remaining steps will also be decreased when steps are converted to memories. (See page 24).

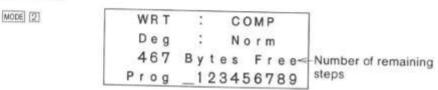

There are two methods to determine the current number of remaining steps:

① When MODE □ EXE are pressed in the RUN mode, the number of remaining steps will be displayed together with the number of memories.

Example:

② Specify the WRT mode (MODE ②), and the number of remaining steps will appear. At this time the status of the program areas can also be determined.

Basically, one function requires a single step, but there are some commands where one function requires two steps.

- One function/one step: sin, cos, tan, log, (,), :, A, B, 1, 2, 3, etc.
- One function/two steps: Lbl 1, Goto 2, Prog 8, etc.

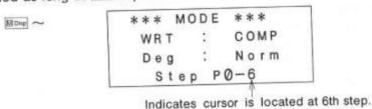

Each step can be verified by the movement of the cursor:

Example:

Present cursor position
$$\rightarrow \begin{array}{c} ? \rightarrow A : \sqrt{3} \times A^2 \\ \sqrt{2} \div 1 \times 2 \times A \times 3 \end{array}$$

At this time, each press of a cursor key (or) will cause the cursor to move to the next sequential step. For example:

The display will show at what step of the program the cursor is currently located as long as Moon is pressed.

4-5 PROGRAM AREAS AND COMPUTATION MODES

This unit contains a total of 10 program areas (P0 through P9) for the storage of programs. These program areas are all utilized in the same manner, and 10 independent programs can be input. One main program (main routine) and a number of secondary programs (subroutines) can also be stored. The total number of steps available for storage in program areas P0 through P9 is 486 maximum.

Specification of a program area is performed as follows:

RUN mode: Press any key from 0 through 9 after pressing the Prog key.

Then press EXE .

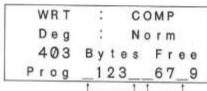

Example: P 0 Prog 0 E

P 0 Prog 0 EXE
P8 Prog 8 EXE

WRT mode: Use or to move the cursor under the program area to be specified and press [EXE].

Only the numbers of the program areas that do not yet contain programs will be displayed. " _ " symbols indicate program areas which already contain programs.

Example:

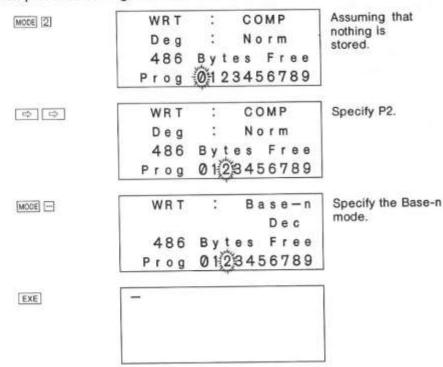

Programs already stored in these program areas.

Program area and computation mode specification in the WRT mode

Besides normal function computations, to perform binary, octal, decimal and hexadecimal computations and conversions, standard deviation computations, and regression computations in a program, a computation mode must be specified. Program mode specification and program area specification are performed at the same time.

First the WRT mode is specified (MODE 2), and then a computation mode is specified. Next, the program area is specified, and, when EXE is pressed, the computation mode is memorized in the program area. Henceforth, stored programs will be accompanied with the computation mode.

Example: Memorizing the Base-n mode in P2.

As shown above, the computation mode will be memorized into a program area.

^{*} In this mode, program execution begins when EXE is pressed.

Cautions concerning the computation modes

All key operations available in each computation mode can be stored as programs, but, depending on the computation mode, certain commands or functions cannot be used.

Base-n mode

- . Function computations cannot be performed.
- . Units of angular measurement cannot be specified.
- All program commands can be used.
- Be sure to include a "▲" at the final result output to return to the previous computation mode when a program execution is terminated. Failure to do so may result in a decimal display or an error.

SD1, SD2 mode

- Among the program commands, Dsz, > and < cannot be used.

LR1, LR2 mode

- Among the program commands, \Rightarrow , =, \pm , Isz, \geq , \leq , Dsz, > and <cannot be used.

4-6 ERASING PROGRAMS

Erasing of programs is performed in the PCL mode. Press WOOE 3 to specify the PCL mode. There are two methods used to erase programs: erasing a program located in a single program area, and erasing all programs.

Erasing a single program

To erase a program in a single program area, specify the PCL mode and press the AC key after specifying the program area.

xample: Erase the	program in P3 only.	
Operation	Display	
MODE [3]	PCL : COMP	P0, P3 and P9 al-
	Deg : Norm	ready contain programs.
	324 Bytes Free	programs.
	Prog 2_45678	
4 4 4	PCL : COMP	Align cursor with P3.
	Deg : Norm	
	324 Bytes Free	
	Prog _12-45678_	
AC	PCL : COMP	Number 3 appears
	Deg : Norm	after deletion.

4-7 CONVENIENT PROGRAM COMMANDS

The programs for this unit are made based upon manual computations. Special program commands, however, are available to allow the selection of the formula, and repetitive execution of the same formula. Here, some of these commands will be used to produce more convenient programs.

Jump commands

Jump commands are used to change the flow of program execution. Programs are executed in the order that they are input (from the lowest step number first) until the end of the program is reached. This system is not very convenient when there are repeat computations to be performed or when it is desirable to transfer execution to another formula. It is in these cases, however, that the jumps commands are very effective. There are three types of jump commands: a simple unconditional jump to a branch destination, conditional jumps that decide the branch destination by whether a certain condition is true or not, and count jumps that increase or decrease a specific memory by one and then decide the branch destination after checking whether the value stored equals zero or not.

Unconditional jump

The unconditional jump is composed of "Goto" and "Lbl". When program execution reaches the statement "Goto n" (where n is a number from 0 through 9), execution then jumps to "Lbl n" (n is the same value as Goto n). The unconditional jump is often used in simple programs to return execution to the beginning for repetitive computations, or to repeat computations from a point within a program.

Unconditional jumps are also used in combination with conditional and count jumps.

Example: The previously presented program to find the surface area and volume of a regular tetrahedron will be rewritten using "Goto 1" and "Lbl 1" to allow repeat computations.

The previous program contained:

?,
$$\rightarrow$$
, A, $:$, $\sqrt{}$, 3, \times , A, x^2 , \checkmark , \checkmark , 2, \div , 1, 2, \times , A, x^3 , 3

19 steps

^{*} Hereinafter, commas (,) will be used to separate steps for the sake of clarity.

Add "Goto 1" to the end of the program, and add "Lbl 1" to the beginning of the program as the branch destination.

If this is simply left the way it is, however, the volume will not be displayed and execution will move immediately to the input of one side at the beginning. To prevent this situation, insert a display command (\triangle) in front of the "Goto 1".

The complete program with the unconditional jump added should look like this:

Lbl, 1, :, ?,
$$\rightarrow$$
, A, :, $\sqrt{}$, 3, \times , A, x^2 , \checkmark , \checkmark , 2, \div , 1, 2, \times , A, x^3 , 3, \checkmark , Goto, 1

25 steps

Now let's try executing this program.

* For details on inputting programs and editing programs, see sections 4-1 and 4-2.

*Henceforth, the displays will only show computation result output.

Operation		Display	
Prog [O] EXE	?		Stored in P0.
10 EXE		173.2050808	The length of the
EXE		117.8511302	side=10
EXE	?		
7.5 EXE		97.42785793	The length of the
EXE		49.71844555	side=7.5
EXE	7		

Since the program is in an endless loop, it will continue execution. To terminate execution, press [MODE] [1].

MODE [1]

* *	*	MODE	***
F	U	١ :	COMP
	e	; ;	Norm
	S	tep	0

Besides the beginning of the program, branch destinations can be designated at any point within the program.

Example: Compute y=ax+b when the value for x changes each time, while a and b can also change depending upon the computation.

Program

When this program is executed, the values for a and b are stored in memories A and B respectively. After that, only the value for x can be changed.

In this way an unconditional jump is made in accordance with "Goto" and "Lbl", and the flow of program execution is changed. When there is no "Lbl n" to correspond to a "Goto n", an error (Go ERROR) is generated.

Conditional jumps

The conditional jumps compare a numeric value in memory with a constant or a numeric value in another memory. If the condition is true, the statement following the ">" is executed, and if the condition is not true, execution skips the statement and continues following the next "", ":" or ""."

Conditional jumps take on the following form:

Left	Relational	Right	State-	1 1.	State-
		side	⇒ ment	1 4	ment
side	operator	side	mone	-	

^{★ #} represents carriage return function (see page 118).

One memory name (alphabetic character from A through Z), constant numeric values or computation formulas (A \times 2, D-E, etc.) are used for "left side" and "right side".

The relational operator is a comparison symbol. There are 6 types of relational operators: =, \pm , \geq , \leq , >, <.

Left side = right side (left side equals right side)

Left side + right side (left side does not equal right side)

Left side ≥ right side (left side is greater than or equal to right side)

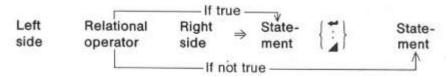

Left side ≤ right side (left side is less than or equal to right side)

Left side > right side (left side is greater than right side)

Left side < right side (left side is less than right side)

^{*} Anyone can be used.

The "⇒" is displayed when self □ are pressed. If the condition is true, execution advances to the statement following ⇒. If the condition is not true, the statement following ⇒ is skipped and execution jumps to the statement following the next "◄", ": " or "◄".

A statement is a computation formula (sin A×5, etc.) or a program command (Goto, Prog, etc.), and everything up to the next "♣", ":" or "◢" is regarded as one statement.

Example: If an input numeric value is greater than or equal to zero, compute the square root of that value. If the input value is less than zero, reinput another value.

Program

16 steps

In this program, the input numeric value is stored in memory A, and then it is tested to determine whether it is greater than, equal to or less than zero. If the contents of memory A are greater than or equal to 0 (not less than zero), the statement (computation formula) located between "⇒" and "⊿" will be executed, and then Goto 1 returns execution to LbI 1. If the contents of memory A are less than zero, execution will skip the following statement to the next "⊿" and returned to LbI 1 by Goto 1.

Example: Compute the sum of input numeric values. If a 0 is input, the total should be displayed.

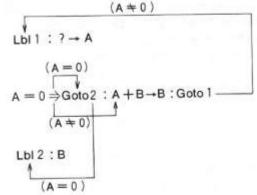

Program

31 steps

In this program, a 0 is first stored in memory B to clear it for computation of the sum. Next, the value input by "? \rightarrow A" is stored in memory A by "A=0 \Rightarrow " and it is determined whether or not the value stored in memory A equals zero. If A=0, Goto 2 causes execution to jump to LbI 2. If memory A does not equal 0, Goto 2 will be skipped and the command A+B \rightarrow B which follows ":" is executed, and then Goto 1 returns execution to LbI 1.

Execution from Lbl 2 will display the sum that has been stored in memory B. Actually, the display command "" is inserted following B, but here it can be omitted.

The following illustration shows the flow of the program:

Count jumps

The count jumps cause the value in a specified memory to be increased or decreased by 1. If the value does equal 0, the following statement is skipped, and the statement following the next "♣", ":" or "♣" is executed. The "Isz" command is used to increase the value in memory by 1 and decide the subsequent execution, while the "Dsz" command is used to decrease the value by 1 and decide.

Example: Increase memory A by one ······ Isz A

Decrease memory B by one ····· Dsz B

Example: Determine the average of 10 input numeric values. Program

In this program, first 10 is stored in memory A, and 0 is stored in memory C. Memory A is used as the "counter" and countdown is performed the specified number of times by the Dsz command. Memory C is used to store the sum of the inputs, and so first must be cleared by inputting a 0. The numeric value input in response to "?" is stored in memory B, and then the sum of the input values is stored in memory C by "B+C→C ". The statement Dsz A then decreases the value stored in memory A by 1. If the result does not equal 0, the following statement, Goto 1 is executed. If the result equals 0, the following Goto 1 is skipped and "C÷ 10" is executed.

Example: Determine the altitude at one-second intervals of a ball thrown into the air at an initial velocity of Vm/sec and an angle of S°. The formula is expressed as: $h = V \sin \theta t - \frac{1}{2}gt^2$, with g = 9.8, with the effects of air resistance being disregarded.

Program

Deg, :,
$$\emptyset$$
, \rightarrow , T, :, ?, \rightarrow , V, :, ?, \rightarrow , S, :, Lbl, 1, :, Isz, T, :, V, \times , sin, S, \times , T, $-$, 9, \cdot , 8, \times , T, x^2 , \div , 2, \blacktriangleleft , Goto, 1 38 steps

In this program the unit of angular measurement is set and memory T is first initialized (cleared). Then the initial velocity and angle are input into memories V and S respectively.

Lbl 1 is used at the beginning of the repeat computations. The numeric value stored in memory T is counted up (increased by 1) by Isz T. In this case, the Isz command is used only for the purpose of increasing the value stored in memory T, and the subsequent jump does not depend upon any comparison or decision. The Isz command can also be used in the same manner as seen with the Dsz command for jumps that require decisions, but, as can be seen here, it can also be used to simply increase values. If, in place of the Isz command, another method such as "T+1→T" is used, five steps are required instead of the two for the (Isz T) method shown here. Such commands are convenient ways of conserving memory space.

Each time memory T is increased, computation is performed according to the formula, and the altitude is displayed. It should be noted that this program is endless, so when the required value is obtained, MODE II are pressed to terminate the program.

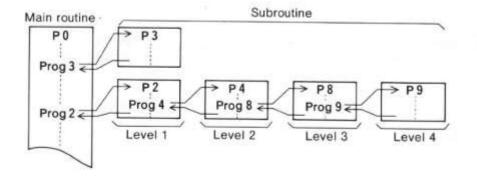

(Summary)

Command	Formula	Operation
Command Unconditional jump	Lbl n Goto n (n=natural number from 0 through 9)	Performs unconditional jump to LbI n corresponding to Goto n .
Conditional jumps	Left Relational Right ⇒ side operator side Statement {	Statements include numeric expressions, Goto commands, etc.
Count jumps	Statement Statement Dsz Memory name: Statement Statement (Memory name consists of single character from through Z, A[], etc.)	jump is performed to the state ment following the next +, : or a Statements include numeric ex pressions, Goto commands, etc.

Subroutines

A program contained in a single program area is called a "main routine". Often used program segments stored in other program areas are called "subroutines".

Subroutines can be used in a variety of ways to help make computations easier. They can be used to store formulas for repeat computations as one block to be jumped to each time, or to store often used formulas or operations for call up as required.

The subroutine command is "Prog" followed by a number from 0 through 9 which indicates the program area.

Example: Prog 0 Jump to program area 0 Prog 2Jump to program area 2

After the jump is performed using the Prog command, execution continues from the beginning of the program stored in the specified program area. After execution reaches the end of the subroutine, the program returns to the statement following the Prog n command in the original program area. Jumps can be performed from one subroutine to another, and this procedure is known as "nesting". Nesting can be performed to a maximum of 10 levels, and attempts to exceed this limit will cause an error (Ne ERROR) to be generated. Attempting to use Prog to jump to a program area in which there is no program stored will also result in an error (Go ERROR).

* A Goto n contained in a subroutine will jump to the corresponding Lbl n contained in that program area.

Example: Simultaneously execute the two previously presented programs to compute the surface areas and volumes of a regular octahedron and tetrahedron.

Express the result in three decimal places.

This example employs two previously explained programs, and the first step is to input the specified number of decimal places (MODE 77 31).

Now let's review the two original programs.

Regular octahedron

Regular tetrahedron

22 steps Total: 45 steps

If the two programs are compared, it is evident that the underlined portions are identical. If these portions are incorporated into a common subroutine, the programs are simplified and the number of steps required is decreased.

Furthermore, the portions indicated by the wavy line are not identical as they stand, but if P1 is modified to: $\sqrt{}$, 2, \div , 3, \times , A, x^{ν} , 3, \div , 4, the two portions become identical.

Now the portions underlined by the straight line will be stored as an independent routine in P9 and those underlined with the wavy line will be stored in P8.

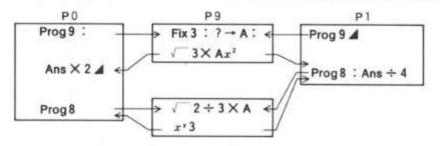

P9 Fix. 3, :, ?,
$$\rightarrow$$
, A, :, $\sqrt{\ }$, 3, \times , A, x^2 12 steps P8 $\sqrt{\ }$, 2, \div , 3, \times , A, x^3 , 3 8 steps

After the common segments have been removed, the remainder of the regular octahedron formula is stored in P0, and that of the regular tetrahedron is stored in P1. Of course, the "Prog 9" and "Prog 8" must be added to jump to subroutines P9 and P8.

With this configuration, execution jumps to program P9 at the beginning of programs P0 and P1, three decimal places are specified, the value for one side is entered, and the surface area of the tetrahedron is computed. The expression "2X" of the original octahedron formula was omitted in P9, so when execution returns to P0, "Ans X 2" is used to obtain the surface of the octahedron. In the case of P1, the result of P9 needs no further modification and so is immediately displayed upon return to P1.

Computation of the volumes is also performed in a similar manner. After a jump is made to P8 for computation, execution returns to the main routines. In P0, the program ends after the volume of the octahedron is displayed. In P1, however, the result computed in P8 is divided by four to obtain the volume of the tetrahedron. By using subroutines in this manner, steps can be shortened and programs become neat and easy to read.

The following illustration shows the flow of the program just presented.

By isolating the common portions of the two original programs and storing them in separate program areas, steps are shortened and programs take on a clear configuration.

Carriage return function

With the carriage return function, EXE is used in place of : to separate commands to produce easy-to-read displays.

Deg:
$$\emptyset \rightarrow T$$
: $? \rightarrow V$: $? \rightarrow S$:
LbI 1: Isz T: $V \times S$ i
n $S \times T - 9 \cdot 8 \times T^2 \div 2 / 4$
Goto 1

Using the carriage return function in the program shown above produces the following display:

Deg V

O T: 7 V: 7 S V

L b I 1: I s z T: V X s i point where EXE is pressed, and the display advances to the next line.

This makes angle unit setting and looped operations, etc. easier to follow.

Operation procedure

MODE 4 EXE (Press in place of □)

O → ALPHA ■ SHIFT 7 → ALPHA ■ SHIFT 7 → ALPHA ■ EXE

SHIFT Lbi □ □ ······

* To include the carriage return function in a program that has already been input, first press SHIFT INS to specify the insert mode and then press EXE. Then, delete the ":".

Deg: $\emptyset \rightarrow T$: $? \rightarrow V$: $? \rightarrow S$: Lb! 1: isz T: VXsi n SXT-9.8XT²÷2 $_{4}$ Goto 1

Align the cursor with the ": " following "Deg" and press SHIFT INS EXE.

Deg [:]
$$0 \rightarrow T$$
: $? \rightarrow V$: $? \rightarrow S$: Lb! 1: Is z T: V×s in S $\times T \rightarrow 9$. 8×T $^2 \div 2$ 4

Delete the " : ".

DEL

Align the cursor with the ":" following "?→S". As above, first insert

* Carriage return can be used in manual operations by pressing SHFT EXE.

4-8 ARRAY-TYPE MEMORIES

Using array-type memories

Up to this point all of the memories used have been referred to by single alphabetic characters such as A, B, X, or Y.

With the array-type memory introduced here, a memory name (one alphabetic character from A through Z) is appended with a subscript such as [1] or [2].

* Brackets are input by ADHA . and ADHA EXP.

Standard	Array-type			
memory	memory			
A	A[0]	C[-2]		
В	A[1]	C[-1]		
C	A[2]	C[0]		
D	A[3]	C[1]		
E	A[4]	C[2]		

Proper utilization of subscripts shortens programs and makes them easier to use. Negative values used as subscripts are counted in relation to memory zero as shown above.

Example: Input the numbers 1 through 10 into memories A through J.

Using standard memories

1.
$$\rightarrow$$
, A, \vdots , 2, \rightarrow , B, \vdots , 3, \rightarrow , C, \vdots , 4, \rightarrow , D, \vdots , 5, \rightarrow , E, \vdots , 6, \rightarrow , F, \vdots , 7, \rightarrow , G, \vdots , 8, \rightarrow , H, \vdots , 9, \rightarrow , I, \vdots , 1, 0, \rightarrow , J 40 steps

Using array-type memories

In the case of using standard memories, inputting values into memories one by one is both inefficient and time consuming. What happens, if we want to see a value stored in a specific memory?

Using standard memories

Lbl, 1, :, ?,
$$\rightarrow$$
, Z, :,
Z, =, 1, \Rightarrow , A, \blacktriangleleft , Z, =, 2, \Rightarrow , B, \blacktriangleleft ,
Z, =, 3, \Rightarrow , C, \blacktriangleleft , Z, =, 4, \Rightarrow , D, \blacktriangleleft ,
Z, =, 5, \Rightarrow , E, \blacktriangleleft , Z, =, 6, \Rightarrow , F, \blacktriangleleft ,
Z, =, 7, \Rightarrow , G, \blacktriangleleft , Z, =, 8, \Rightarrow , H, \blacktriangleleft ,
Z, =, 9, \Rightarrow , I, \blacktriangleleft , Z, =, 1, \emptyset , \Rightarrow , J, \blacktriangleleft ,
Goto, 1

70 steps

Using array-type memories

16 steps

The difference is readily apparent. When using the standard memories, the input value is compared one by one with the value assigned to each memory (i.e. A=1, B=2, ...).

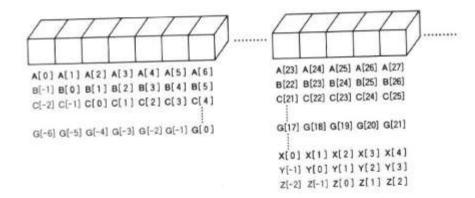

With the array-type memories, the input value is immediately stored in the proper memory determined by "[Z-1]". Formulas (Z-1, A+10, etc.) can even be used for the subscript.

Cautions when using array-type memories

When using array-type memories, a subscript is appended to an alphabetic character that represents a standard memory from A through Z.

Therefore, care must be taken to prevent overlap of memories.

The relation is as follows:

The following shows a case in which array-type memories overlap with standard format memories. This situation should always be avoided.

Example: Store the numeric values from 1 through 5 in memories A[1] through A[5] respectively.

44 steps

In this program, the values 1 through 5 are stored in the array-type memories A[1] through A[5], and memory C is used as a counter memory. When this program is executed, the following results are obtained:

Operation	Display
Prog O EXE	1.
EXE	0.
EXE	3.
EXE	4.
EXE	5.

As can be seen, the second displayed value (which should be 2) in A[2] is incorrect. This problem has occurred because memory A[2] is the same as memory C.

The content of memory C (A[2]) is decreased from 5 to 0 in steps of 1. Therefore, the content of memory A[2] is displayed as 0.

Application of the array-type memories

It is sometimes required to treat two different types of data as a single group. In this case, memories for data processing and those for data storage should be kept separate.

Example: Store data x and y in memories. When an x value is input, the corresponding y value is displayed. There will be a total of 15 pieces of data.

Example program 1

Memory A is used as the data control memory, and memory B is used for temporary storage of the x data. The x data are stored in memories C[1] (memory D) through C[15] (memory R), and the y data are stored in memories C[16] (memory S) through C[30] (memory Z[7]).

1,
$$\rightarrow$$
, A, \downarrow , Defm, 7, $\dot{\cdot}$, Lbl, 1, $\dot{\cdot}$, ?, \rightarrow , C, [, A,], $\dot{\cdot}$, ?, \rightarrow , C, [, A, +, 1, 5,], $\dot{\cdot}$, lsz, A, $\dot{\cdot}$, A, =, 1, 6, \Rightarrow , Goto, 2, $\dot{\cdot}$, Goto, 1, $\dot{\cdot}$, Lbl, 2, $\dot{\cdot}$, 1, 5, \rightarrow , A, $\dot{\cdot}$, ?, \rightarrow , B, $\dot{\cdot}$, B, =, 0, \Rightarrow , Goto, 5, $\dot{\cdot}$, Lbl, 3, $\dot{\cdot}$, B, =, C, [, A,], \Rightarrow , Goto, 4, $\dot{\cdot}$, Dsz, A, $\dot{\cdot}$, Goto, 3, $\dot{\cdot}$, Goto, 2, $\dot{\cdot}$, Lbl, 4, $\dot{\cdot}$, C, [, A, +, 1, 5,], \checkmark , Goto, 2, $\dot{\cdot}$, Lbl, 5

In this program, memories are used as follows:

x data C[1] D	C[2] E	C[3] F	C [4]	C[5]	C[6]	C[7]	C[8]
C[9]	C [10] M	C [11] N	C [12] O	C [13] P	C [14] Q	C [15] R	
y data C [16] S	C [17]	C [18] U	C [19] V	C [20] W	C [21]	C [22]	C [23]
C [24] Z(1)	C [25] Z(2)	C [26] Z(3)	C [27] Z (4)	C [28] Z (5)	C [29] Z (6)	C [30] Z(7)	

Example program 2

The same memories are used as in Example 1, but two types of memory names are used and the \boldsymbol{x} and \boldsymbol{y} data kept separate.

1,
$$\rightarrow$$
, A, $:$, Defm, 7, $:$, Lbl, 1, $:$, ?, \rightarrow , C, [, A,], $:$, ?, \rightarrow , R, [, A,], $:$, lsz, A, $:$, A, =, 1, 6, \Rightarrow , Goto, 2, $:$, Goto, 1, $:$, Lbl, 2, $:$, 1, 5, \rightarrow , A, $:$, ?, \rightarrow , B, $:$, B, =, Ø, \Rightarrow , Goto, 5, $:$, Lbl, 3, $:$, B, =, C, [, A,], \Rightarrow , Goto, 4, $:$, Dsz, A, $:$, Goto, 3, $:$, Goto, 2, $:$, Lbl, 4, $:$, R, [, A,], \blacktriangleleft , Goto, 2, $:$, Lbl, 5

Memories are used as follows:

In this way, the memory names can be changed. However, since memory names are restricted to the letters from A through Z, the expanded memories (MODE) can only be used as array-type memories.

* The memory expansion command (Defm) can be used in a program.

Example: Expand the number of memories by 14 to make a total of 40 available.

Defm, 1, 4, :,

4-9 DISPLAYING ALPHA-NUMERIC CHARACTERS AND SYMBOLS

Alphabetic characters, numbers, computation command symbols, etc. can be displayed as messages. They are enclosed in quotation marks (N.PHA Prog.).

- Alpha-numeric characters and symbols
- Characters and symbols displayed when pressed following ALPHA:
 [,], k, m, µ, n, p, f, space,
 A, B, C, D, E, F, G, H, I, J, K, L, M, N,
 O, P, Q, R, S, T, U, V, W, X, Y, Z
- Other numbers, symbols, calculation commands, program commands $0, 1, 2, 3, 4, 5, 6, 7, 8, 9, (,), \sqrt{}, \epsilon, +, -, \times, \div, ...$ sin, cos, tan, log, ln, ... = $, +, \geq , \leq , >, <, ...$ A, B, C, D, E, F, d, h, b, o Neg, Not, and, or, xor $x, g, x\sigma_n, x\sigma_{n-1}, ...$ \circ (SHIFT MODE 4), ' (SHIFT MODE 5), \circ (SHIFT MODE 6)
- * All of the above noted characters can be used in the same manner as the alphabetic characters.

In the preceding example requiring an input of two types of data (x, y), the prompt "?" does not give any information concerning the type of input expected. A message can be inserted before the "?" to verify the type of data required for input.

The messages "X=" and "Y=" will be inserted into this program.

Lbl, 1, :, ",
$$X$$
, $=$, ", ?, \rightarrow , X , :, ", Y , $=$, ", Y , Y , ...

If messages are included as shown here, the display is as follows: (Assuming that the program is stored in P1)

Messages are also convenient when displaying result in program computations.

Example:

Lbl,
$$\emptyset$$
, :, ", N, =, ", ?, \rightarrow , B, \sim , C, :, \emptyset , \rightarrow , A, :, Lbl, 1, :, C, \div , 2, \rightarrow , C, :, Frac, C, \div , \emptyset , \Rightarrow , Goto, 3, :, Isz, A, :, C, =, 1, \Rightarrow , Goto, 2, :, Goto, 1, :, Lbl, 2, :, ", X, =, ", \blacktriangle , A, \blacktriangle , Goto, \emptyset , :, Lbl, 3, :, ", N, O, ", \blacktriangle , Goto, \emptyset 70 steps

This program computes the x power of 2. A prompt of "N=?" appears for data input. The result is displayed by pressing <code>EXE</code> while "X=" is displayed. When an input data is not the x power of 2, the display "NO" appears and execution returns to the beginning for reinput. Assuming that the program is stored in P2:

Prog 2 EXE
4096 EXE
EXE
EXE
3124 EXE
EXE
512 EXE
EXE

N = ?	
X =	
	12.
N = ?	
NO	
N = ?	
X =	
	9.

^{*}The \(\rightarrow\) symbol (display command) should be included following alpha-numeric characters and symbols to display a calculation result after the characters and symbols.

Strings longer than 16 characters are displayed in two lines. When alphabetic characters are displayed at the end of the bottom line, the entire display shifts upwards and the uppermost line disappears from the display.

Prog 0

968+125-65 1028. Prog 0_

EXE

968+125-65 1028. Prog 0 ABCDEFGHIJKLMNOP

After a while

1028. Prog 0_ ABCDEFGHIJKLMNOP QRSTUVWXYZ

4-10 USING THE GRAPH FUNCTION IN PROGRAMS

Using the graph function within programs makes it possible to graphically represent long, complex equations and to overwrite graphs repeatedly. All graph commands (except the trace function) can be included in programs. Range values can also be written into the program.

Generally, manual graph operations can be used in programs without modification.

Ex. 1) Graphically determine the number of solutions (real roots) that satisfy both of the following two equations.

$$y = x^4 - x^3 - 24x^2 + 4x + 80$$

 $y = 10x - 30$

The range values are as follows:

First, program the range settings. Note that values are separated from each other by commas ", ".

Next, program the equation for the first graph.

Finally, program the equation for the second graph.

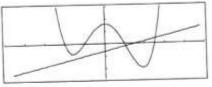

Total 49 steps

When inputting this program, press EXE after input of the ranges and the first equation.

The following should appear on the display when the program is executed:

MODE 1

Prog O EXE

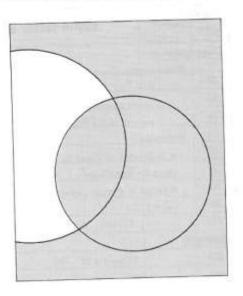

A "\[\]" can be input in place of the \[\text{EXE} \] key operation after the first equation to suspend execution after the first graph is produced. To continue execution to the next graph, press \[\text{EXE} \].

The procedure outlined above can be used to produce a wide variety of graphs.

The library at the end of this manual includes a number of examples of graph programming.

PROGRAM LIBRARY

(Prior to use)

- Always check the number of remaining steps before attempting to store programs.
- The library is divided into two parts: a calculation section and a graph section. The calculation section shows only answers, while the graph section shows whole displays.
- To make programs in the graph section easier to follow, is used to indicate carriage returns. The EXE key should be pressed wherever - appears (- does not appear on the display).
- Press the Graph key whenever "Graph" appears within a program (Graph Y = indicated).
- If it is necessary to specify a calculation mode (e.g. Base-n, SD1) in a program, be sure to specify it after pressing wood 2 (WRT mode).

Then start programming by pressing EXE.

CASIO PROGRAM SHEET

Prime factor analysis 1

Description

Prime factors of arbitrary positive integers are produced.

For 1< m <10"

prime numbers are produced from the lowest value first. "END" is displayed at the end of the program.

(Overview)

w is divided by 2 and by all successive odd numbers (d = 3, 5, 7, 9, 11, 13,...) to check for divisibility.

Where d is a prime factor, $m_i = m_{i-1}/d$ is assumed, and division is repeated until $\sqrt{m_i} + 1 \le d$.

Example

<15

 $119 = 7 \times 17$

(2)

 $1234567890 = 2 \times 3 \times 3 \times 5 \times 3607 \times 3803$

(3)

 $987654321 = 3 \times 3 \times 17 \times 17 \times 379721$

).	2

Program for		No.	
- 3	Greatest common measure	2	

Description

Euclidean general division is used to determine the greatest common measure for two integers a and b.

For $|a|,|b| < 10^{\circ}$, positive values are taken as $< 10^{\circ\circ}$

(Overview)

$$\begin{array}{l} n_0 = \max \left(|a|, |b| \right) \\ n_1 = \min \left(|a|, |b| \right) \\ n_k = n_{k-2} - \left(\frac{n_{k-2}}{n_{k-1}} \right) n_{k-1} \\ k = 2, 3 \dots \end{array}$$

If $n_k = 0$, then the greatest common measure (c) will be n_{k-1} .

Example

(1)		
4.17		

When
$$a = 238$$

$$a = 23345$$

$$a = 522952$$

$$b = 374$$

$$b = 9135$$

$$b = 3208137866$$

$$c = 998$$

PROGRAM SHEET

Program for

Definite integrals using Simpson's rule

3

Description

$$\begin{split} 1 &= \int_{a}^{b} f\left(x\right) dx = \frac{h}{3} \left| y_{0} + 4 \left(y_{1} + y_{3} + \ldots + y_{2m-1} \right) + 2 \left(y_{2} + y_{4} + \ldots + y_{2m-2} \right) + y_{2m} \right| \\ h &= \frac{b-a}{2m} \end{split}$$

The right-hand portion of the above equation can be transformed as follows.

$$1 = \frac{h}{3} |y_0 + \sum_{i=1}^{n} (4y_{2i-1} + 2y_{2i}) - y_{2m}|$$

Let
$$f(x) = \frac{1}{x^2 + 1}$$

Example

(1)
$$a = 0$$
, $b = 1$, $2m = 10$

$$I = \int_0^1 \frac{1}{x^2 + 1} d_x = 0.7853981537$$
(2) $a = 2$, $b = 5$, $2m = 20$

$$I = \int_0^5 \frac{1}{x^2 + 1} d_x = 0.2662526769$$

Program for

Minimum loss matching

No.

5

Description

Calculate R_1 and R_2 which match Z_0 and Z_1 with loss minimized. $(Z_0 > Z_1)$

$$Z_0 \xrightarrow{\circ} R_1 \xrightarrow{R_1} \circ Z_1$$

$$R_1 = Z_0 \sqrt{1 - \frac{Z_1}{Z_0}}$$
 $R_2 = \frac{Z_1}{\sqrt{1 - \frac{Z_1}{Z_0}}}$

$$\label{eq:minimum} \text{Minimum loss L}_{min}\!=\!20\,\log\left(\!\sqrt{\frac{Z_0}{Z_1}}+\sqrt{\frac{Z_0}{Z_1}-1}\right)\!\left[\text{dB}\right]$$

Example

Calculate the values of R1. R2 and Lmin for Z0=500 Ω and Z1=200 Ω .

Preparation and operation

Store the program written on the next page.

● Execute the program as shown below in the RUN mode ([MODE [T]).

Program for

Cantilever under concentrated load

6

Description

E: Young's modulus (kg/mm²)

1 : Geometrical moment of inertia (mm*)

a : Distance of concentrated load from support (mm)

P : Load [kg]

x : Distance of point of interest from the support (mm)

Deflection y [mm], Angle of deflection s ["], Bending moment M [kg · mm]

① 1>x>a

$$y = \frac{Pa^{3}}{6E1} - \frac{Pa^{2}}{2E1}x$$

$$y = \frac{P}{6E1}x^3 - \frac{Pa}{2E1}x^2$$

$$s = \tan^{-1} \left(-\frac{Pa^{-1}}{2EI} \right)$$

$$s = \tan^{-1} \left(\frac{Px}{2EI} (x - 2a) \right)$$

$$M = 0$$
 (shearing load $Ws = 0$)

$$M = P(x - a)$$
 (shearing load $Ws = P$)

Example

142

 $E = 4000 \text{ kg/mm}^2$

 $1 = 5 \, \text{mm}^4$

P = 2 kg

a = 30 mm

What are deflection, angle of deflection, bending moment and shearing load at x = 25 mm and x = 32 mm?

Preparation and operation

PROGRAM SHEET

Program for No. Parabolic movement 7

Description

$$x = (V_0 \cos a) \cdot t$$

$$y = (\mathbf{V_0} \sin \mathbf{a}) \cdot \mathbf{t} - \frac{1}{2} \mathbf{g} \, \mathbf{t}^{\mathbf{y}} + \mathbf{h}$$

$$g = 9.8 \text{ (m/s}^2\text{)}$$

Vo (m/s)

a ["]

At (sec.)

h (m)

Example Initial velocity Vo=130(m/sec.)

Initial angle a = 25 (")

Height h = 0 (m)

 $\Delta t = 0.5 (sec.)$

Plot the trace of movement in intervals of Δt .

Preparation and operation

Store the program written on the next page.

Execute the program as shown below in the RUN mode (WODE III).

Normal distribution

8

Description

Obtain normal distribution function $\phi(x)$ (by Hastings' best approximation).

$$\phi(x) = \int_{-\infty}^{1} \phi t dx$$

$$\phi t = \frac{1}{\sqrt{2\pi}} e^{-\frac{x^{2}}{2}}$$

$$\frac{x^2}{2}$$

$$Put \ t = \frac{1}{1 + Px}$$

$$\phi(x) = 1 - \phi t (c_1 t + c_2 t^2 + c_3 t^3 + c_4 t^4 + c_5 t^6)$$

$$C_3 = 1.78147937$$

$$C_1 = 0.31938153$$

$$C_4 = -1.821255978$$

$$C_2 = -0.356563782$$

$$C_6 = 1.330274429$$

Example

Calculate the values of $\phi(x)$ at x = 1.18 and x = 0.7.

PROGRAM SHEET

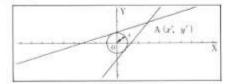

Program for

Circle and points of tangency

.

9

Description

Circle formula

$$x^2 + y^2 = r^2$$

Formula for tangent lines passing through point A (x', y')

$$y-y'=m(x-x')$$

* m is the tangent line slope

Draw a line from point A (x', y') to a circle with radius τ , and determine the slope m and intercept b (=y'-mx'). Also, read the coordinates of the tangent using the trace function, and use the factor function to magnify the graph.

Example

(NOTE)

• r=x' generates an Ma ERROR.

PROGRAM SHEET

Program for Rotation of figures No. 10

Description

Coordinate conversion formula $(x, y) \rightarrow (x', y')$

 $x' = x \cos \theta - y \sin \theta$ $y' = x \sin \theta + y \cos \theta$

Draw a figure that represents a degree rotation of a triangle.

Example

Draw the figure of the triangle (A (2, 0.5), B (6, 0.5), C (5, 1.8)) rotated 30°

(NOTE)

- . The blinking point can be moved using the cursor keys.
- * To terminate the program, press the AC key during graph display.
- A triangle cannot be drawn if the converted coordinates (E' (set the value of x to 5.)) exceed the preset range values.

Preparation and operation

Store the program written on the next page.

PROGRAM SHEET

Program for

Graph variation by parameters

No.

Description

Damped vibration

(i) #>n (Overdamping)

$$P_1 = -\epsilon + \sqrt{\epsilon^2 - n^2}$$
, $P_2 = -\epsilon - \sqrt{\epsilon^2 - n^2}$

11

(ii) ε=n (Critical damping)

$$x = |x_0 + (v_0 + \varepsilon x_0)t| e^{-t}$$

(iii) ¢<n (Damping vibration)

$$x = e^{-\epsilon t} |x_0 \cos \sqrt{n^2 - \epsilon^2} t + \frac{v_0 + \epsilon x_0}{\sqrt{n^2 - \epsilon^2}} \cdot \sin \sqrt{n^2 - \epsilon^2} t|$$

Example

Draw a graph of the damping vibration that possesses the following parameters:

- (1) $\epsilon = 0.1$
- (2) $\epsilon = 0.2$ n = 0.2
- (3) $\epsilon = 0.2$

- n = 1.5 $x_0 = 2.5$
- $x_0 = 2$
- n = 0.18

- $v_0 = 1$
- $v_0 = 0.6$
- $x_0 = -2$ $v_0 = 1.5$

Description

Program for

i Logarithmic regression curve Regression formula: $y = A + B \ln x$

$$B = \frac{n \cdot \sum (y \cdot \ln x) - \sum \ln x \cdot \sum y}{n \sum (\ln x)^2 - (\sum \ln x)^2}$$

57.459

ii Exponential regression curve Regression formula: $y = A \cdot e^{iw}$

$$B = \frac{n \sum (x \ln y) - \sum x \cdot \sum \ln y}{n \cdot \sum x^2 - (\sum x)^2}$$

$$A = e \left(\frac{\sum \ln y - B \cdot \sum x}{n} \right)$$

iii Power regression curve

Regression formula: $y = A \cdot x^+$

$$B = \frac{n \sum (\ln x \cdot \ln y) - \sum \ln x \cdot \sum \ln y}{n \cdot \sum (\ln x)^2 - (\sum \ln x)^2}$$

$$A = \frac{\sum \ln y - B \cdot \sum \ln x}{n}$$

CASIO PROGRAM SHEET

Program for Regression curve No. 13

Example

Perform exponential regression of the following data:

хi	2.2	5.6	9.5	13.8	18.0	23.2	29.9	37.8
y i	35.6	28.1	23.0	17.9	12.9	10.2	6.2	4.0

Draw an exponential regression curve, and use the trace function to estimate the value for y when X=20. Also, obtain the values of A and B of the regression formula.

Range values:

PROGRAM SHEET

Program for Parade diagram No. 14

Description

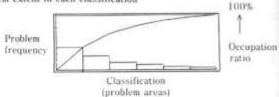

One example of a parade diagram application is problem solving in QC activities. The problem is quantitatively analyzed based on actual data concerning its extent, and the main points demanding attention are determined.

Horizontal axis: Problem classification

(Item 6 in this example)

Vertical axis : (Right) Occupation ratio

(Left) Problem extent in each classification

Example

Create a parade diagram using the data on the right.

Problem areas	Frequency
A	105
B	65
C	35
D	25
E	15
Others	10

Preparation and operation

Store the program written on the next page.

REFERENCE MATERIAL

■ Manual computations

Mode speci- fication	COMP mode (MODE ⊞)	Four arithmetic computations and function computations.
	Base-n mode (MODE □)	Binary, octal, decimal, hexadecimal conversions and computations, logical operations.
	SD1 mode (™○○E⊠)	Standard deviation computations (1-variable statistical computations).
	LR1 mode (™○○E ⊕)	Regression computations (paired variable statistical computations).
	SD2 mode (SHIFT MCDE ⋈)	For production of single variable statistical graphs. (Bar graphs, line graphs, normal distribution curves)
	LR2 mode (SHIFT MODE +)	For production of paired variable statistical graphs. (Regression lines)
Functions	Type A func- tions	Function command input immediately before numeric value. (sin, cos, tan, sin¹, cos¹, tan¹, (sinh, cosh, tanh, sinh¹, cosh¹, tanh¹ — fx-6500G), (log, ln, e², 10², √, ³√, Abs, Int, Frac
	Type B func- tions	Function command input immediately after numeric value. $(x^2, x^{-1}, x!)$
	Paired vari- able functions	Function command input between two numeric values. Numeric value enclosed in parentheses input immediately after function command. (A x* B (A to the Bth power), B*\sqrt{A} A (A to the 1/Bth power), Pol (A,B), Rec (A,B) * A and B are numeric values.
	Immediately executed functions	Displayed value changed with each press of a key. [ENG, ENG, ***)

Binary, octal, decimal, hex- adecimal computations	Setting num- ber system	Decimal Dec EXE (Dec = 1) Hexadecimal Hex EXE (Hex = 1) Binary Bin EXE (Bin = log) Octal Oct EXE (Oct = lin)
	Number system specification	Number system for the numeric value entered immediately after can be specified regardless of the currently set number system. To specify: Decimal
	Logical opera- tions	A input numeric value converted to binary and each bit computed. Result converted back to number system used for input, and then displayed. Not Reverse of each bit and Logical product of each bit or Logical sum of each bit xor Exclusive logical sum of each bit
Standard de- viation com- putations	Data clear	SHIFT Sci EXE (Sci = AC)
	Data input	Data (;frequency) DT (DT = T) * Frequency can be omitted.
	Data deletion	Data (;frequency) CL (CL = 37) * Frequency can be omitted.
	Result display	Number of data (n)

Regression computations	Data clear	SHIFT ScI EXE (ScI = AC)
	Data input	x data, y data (; frequency) \Box T (\Box T = \Box T) * Frequency can be omitted.
	Data deletion	x data, y data (;frequency) $(CL = x^2)$ * Frequency can be omitted.
	Result display	Number of data (n)

Special func-	Ans function	The latest result obtained in manual or program computations is stored in memory. It is recalled by pressing Ans. * Mantissa of numeric value is 10 digits.
	Replay func- tion	 After computation results are obtained, the computation formula can be recalled by pressing either or . If an error is generated, pressing either or will cancel the error and the point where the error was generated will be indicated by a blinking cursor.
	Multistatement function	Colons are used to join a series of statements or computation formulas. If joined using "", the computation result to that point is displayed.
	Memory ex- pansion	The Number of memories can be expanded from the standard 26. Memories can be expanded in units of one up to 60 (for a total of 86). Eight steps are required for one memory expansion. MODE: number of memories to be expanded EXE.

Graph function	Range func- tion	Graph range settings XmaxMaximum value of x XminMinimum value of x XsclScale of X-axis (space between points) YmaxMaximum value of y YminMinimum value of y YsclScale of Y-axis (space between points)
	Trace function	Moves pointer (blinking dot) on graph. x-y coordinates can be read.
	Plot function	Marks pointer (blinking dot) at any coordinate on the graph display.
	Line function	Connects with a straight line two points created with plot function.
	Factor function	Magnifies or reduces a graph using pointer (blinking dot) as center.

■ Program computations

Program	Input mode	WRT mode (MODE 2)
input	Computation mode	Mode that conforms with program specified by: MODE ⊕, MODE ⋈ MODE ⋈, MODE ⋈,
	Program area specification	Cursor is moved to the desired program area number (P0 through P9) using and , and EXE is pressed.
Program ex- ecution	Execution mode	RUN mode (MODE 1)
	Program area specification	Execution starts with Prog program area No. EXE. Program area No.: 0~9
Program editing	Input mode	WRT mode (MODE 2)
	Program area specification	Cursor is moved to the desired program area number (P0 through P9) using or , and EXE are pressed.
	Editing	Cursor is moved to position to be edited using (a), (b) or (b). • Press correct key for corrections. • Press (b) for deletions. • Press (c) to specify insert mode for insertion.
Program	Erase mode	PCL mode (MODE 3)
erasing	Erasing a program in a single program area	Cusor is moved to the desired program area number (P0 through P9) using and and and is pressed.
	Erasing the programs in all program areas	Press [SHET] [MG] ([MG] = [DEL]).

Program commands	Unconditional jump	Program execution jumps to the LbI n which corresponds to Goto n . * $n = 0$ through 9
	Conditional jumps	If conditional expression is true, the statement after "⇒" is executed. If not true, execution jumps to the statement following next "♣", ": " or "♣". True F R F ⇒ S : S Not true R: Relational operator S: Statement * The relational operator is: =, ‡, >, <, ≥, ≤.
	Count jumps	The value in a memory is increased or decreased. If the value does not equal 0, the next statement is executed. If it is 0, a jump is performed to the statement following the next "".": " or ".". Increase
	Subroutines	Program execution jumps from main routine to subroutine indicated by Prog n ($n = 0$ through 9). After execution of the subroutine, execution returns to the point following Prog n in the original program area.

Error messages

Message	Meaning	Countermeasure	
Syn ERROR Contains an error. Formula in a program contains an error.		(1) Use or to display the point where the error was generated and correct it. (2) Use or to display the point where the error was generated, press AC and then correct the program in the WRT mode.	
Ma ERROR	Computation result exceeds computation range. Computation is performed outside the input range of a function. Illogical operation (division by zero, etc.)	① ② ③ Check the input numeric value and correct it. When using memories, check that the numeric values stored in memories are correct.	
Go ERROR	 No corresponding Lbl n to Goto n. No program stored in program area P n which corresponds to Prog n. 	 Correctly input a Lbl n to correspond to the Goto n, or delete the Goto n if not required. Store a program in program area P n to correspond to Prog n, or delete the Prog n if not required 	
Ne Nesting of subroutines be Prog n exceeds 10 levels.		 Ensure that Prog n is not used to return from subroutines to main routine. If used, delete any unnecessary Prog n. Trace the subroutine jump destinations and ensure that no jumps are made back to the original program area. Ensure that returns are made correctly. 	

Stk ERROR	 Execution of computa- tions that exceed the capacity of the stack for numeric values or stack for computations. 	Simplify the formulas to keep stacks within 8 levels for the numeric values and 20 levels for the computations. Divide the formula into two or more parts.
Mem ERROR	 Attempt to use a memory such as Z[5] when no memory has been ex- panded. 	Expand memories using MODE
Arg ERROR	Incorrect argument speci- fication for a command that requires an argument.	Correct the argument. Sci n, Fix n: n= natural number from 0 through 9. Goto n, Lbl n, Prog n: n = natural number from 0 through 9. Defm n: n = natural number between 0 to the number of remaining steps.

■ Input range of functions (general principles)

Function name	Input range		
sin x , cos x , tan x sin ^{-1}x , cos ^{-1}x tan ^{-1}x e^x sinh x ,* cosh x * tanh x * sinh ^{-1}x * cosh ^{-1}x * tanh ^{-1}x * log x , ln x 10° \sqrt{x} x^2 $x^{-1}(^{1}/x)$ $\sqrt[3]{x}$	$ x \le 9 \times 10^{9} \text{ degree}$ $ x \le 5 \times 10^{7} \pi \text{ rad}$ $ x < 10^{100} \text{gra}$ $ x \le 1$ $ x < 10^{100}$ $-10^{100} < x \le 230.2585092$ $ x \le 230.2585092$ $ x < 10^{100}$ $ x < 5 \times 10^{99}$ $1 \le x < 5 \times 10^{99}$ x < 1 $0 < x < 10^{100}$ $-10^{100} < x < 100$ $0 \le x < 10^{100}$ $ x < 10^{100}$ $ x < 10^{100}$ $ x < 10^{100}$		
$x!$ x^y $\sqrt[y]{x}(x^{1/y})$ Pol (x, y) Rec (r, θ)	$0 \le x \le 69$ (x is an integer.) When $x < 0$, y is a natural number. $x = 0 \to y > 0$ $x \ge 0$, $y \ne 0$ $ x < 10^{100}$, $ y < 10^{100}$ However, $\sqrt{x^2 + y^2} < 10^{100}$ $ r < 10^{100}$, $ \theta \le 9 \times 10^{9}$ degree $ \theta \le 5 \times 10^{7} \pi$ rad $ \theta < 10^{10}$ gra		

^{*} Not available with the fx-6000G.

Binary number	(Positive) 111111111111111 $\ge x \ge 0$
	(Negative) 1111111111111111 $\ge x \ge$
	100000000000000
Octal number	(Positive) 17777777777 $\ge x \ge 0$
	(Negative) $3777777777777777777777777777777777777$
Hexadecimal	(Positive) 7 FFFFFFF $\geq x \geq 0$
number	(Negative) FFFFFFF $\geq x \geq 80000000$
Decimal→	$ x \leq 9999999$. 999. If degrees, minutes and
sexagesimal	seconds exceed a total of 11 digits, the higher
	(degrees, minutes) values will be given priority,
	and displayed in 11 digits.
Statistical com- putation	$ x < 10^{50}, y < 10^{50}, n < 10^{100}$

* As a rule, the accuracy of a result is ± 1 at the 10th digit.

* Errors may be cumulative with such internal continuous computations with the functions, x^{ν} , $x^{1/\nu}$, x!, $\sqrt[n]{x}$, and accuracy is sometimes affected.

* In $\tan x$, $|x| \pm 90^{\circ} \times (2n+1)$, $|x| \pm \pi/2 \text{rad} \times (2n+1)$, $|x| \pm 100 \text{ gra } (2n+1)$, (*n* is an integer.)

* With $\sinh x$ and $\tanh x$, when x=0, errors are cumulative and accuracy is affected.

SPECIFICATIONS

Model: fx-6000G/fx-6500G

Computations

Basic computation functions:

Negative numbers, exponents, parenthetical addition/subtraction/multiplication/division(with priority sequence judgement function—true algebraic logic).

Built-in functions:

Trigonometric/inverse trigonometric functions (units of angular measurement: degrees, radians, grads), hyperbolic/inverse hyperbolic functions,* logarithmic/exponential functions, reciprocals, factorials, square roots, cube roots, powers, roots, squares, decimal-sexagesimal conversions, binary-octal-hexadecimal conversions/computations, coordinate transformations, #, random numbers, absolute values, integers, fractions.

 These functions are not available with the fx-6000G.

Statistical computation functions: Standard deviation—number of data, sum, sum of squares, mean, standard deviation (two types). Linear regression—number of data, sum of x, sum of y, sum of squares of y, sum of squares of x, mean of x, mean of y, standard deviation of x (two types), standard deviation of y (two types), constant term, regression coefficient, correlation coefficient, estimated value of x, estimated value of y.

Memories:

26 standard (86 maximum)

Computation range:

±1×10^{-∞}~±9.99999999×10^{-∞} and 0. Internal operation uses 13-digit mantissa.

Rounding:

Performed according to the specified number of significant digits or the number of specified de-

cimal places.

Programs

Number of steps:

486 maximum

Jump function:

Unconditional jump (Goto), 10 maximum

Conditional jump $(=, \pm, >, <, \ge, \le)$

Count jumps (isz, Dsz)

Subroutines:

9 levels

Number of stored

10 maximum (P0 to P9)

programs:

Check function:

Program checking, debugging, deletion, addi-

tion, etc.

Graph function

Built-in function

graphs:

sin, cos, tan, sin¹, cos¹, tan¹, sinh*, cosh*, tanh*,

 $sinh^{-1*}$, $cosh^{-1*}$, $tanh^{-1*}$, log, ln, 10*, e^x , x^z , $\sqrt{}$,

3√_, x-1

* Not available with the fx-6000G.

Graph commands:

Graph, Range, Plot, Trace, Factor, Line, X→Y

Graphs:

User generated functions, statistical graphs (bar

graphs, line graphs, normal distribution curves,

regression lines)

Common section

Power supply:

Three lithium batteries (CR2032C)

Power consump-

0.03W

Battery life:

tion:

Approximately 130 hours on type CR2032C.

Auto power off:

Power is automatically switched off approx-

imately 6 minutes after last operation.
